## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

## WELCOME INTRODUCTION

Dear Invited guests, Colleagues and Students,

On behalf of the Scientific and Organizing Committee, we welcome you to the 2nd OPEN-AIR CITIES International Conference, organized by Open-Air Cities, HAROKOPIO UNIVERSITY of Athens - Postgraduate Programme "Sustainable Development", SYROS INSTITUTE and in co-organization with the EUROPEAN COOPERATION IN SCIENCE & TECHNOLOGY, Cost Action ECO4ALL.

This conference aims to present and disseminate research results related to the Sustainable Development of cities and regions at a global level.

The main subject is the presentation of relevant research in the field of Sustainable Development.

The conference is organized and structured on the four main pillars of Sustainable Development, which in fact are also the main pillars of Urban and Regional Development: Environment, Economy, Society and Culture. Each of these pillars includes its subcategories, which are detailed through the thematic sections related to the 17 Global Goals of Sustainable Development.

The conference brings together many distinguished researchers of Local and Regional Sustainable Development and Urban Reconstruction from many countries all over the world. Participants have the opportunity to present new research, exchange information, and discuss current issues.

The papers that will be presented at the conference have the possibility to be published in the international journal *Sustainable Development, Culture, Traditions Journal* ([www.sdct-journal.com](http://www.sdct-journal.com)) (ISSN: 2241-4010), after their final submission to the journal.

I would like to warmly thank the Ambassador of the Republic of Austria, Mrs. Vogl Gerda, who has done us the honour of visiting Harokopio University and welcoming this conference.

I would also like to extend particular thanks to the conference Keynote speakers: Joseph Stefanou, Konstantinos Moraitis, Olesea Plotnic, George Kremlis, Josep-Maria Arauzo-Carod, Georgios Panetsos, Kalliopi Radoglou, Minas Angelidis, Konstantinos Lalenis, Constantina Kottaridi, Alcestis Rodi, Aspa Gospidini and Luca Salvati.

Also, I would like to thank all the participants, as well as all the colleagues who have prepared the very interesting sessions you will attend at the conference.

I sincerely hope that all participants gain valuable scientific knowledge and find the 2nd OPEN-AIR CITIES International Conference an enjoyable and fulfilling experience.

### **Chair of the Organizing & Scientific Committees**

#### **Roido Mitoula**

*Dean, School of Environment, Geography and Applied Economics,  
HAROKOPIO UNIVERSITY OF ATHENS*

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

## SCIENTIFIC COMMITTEE

**Abeliotis Konstantinos**, Professor, Harokopio University of Athens  
**Arauzo-CarodJosep-Maria**, Professor, Universitat Rovira i Virgili  
**Angelidis Minas**, Em. Professor, National Technical University of Athens  
**Astara Olga-Eleni**, Assistant Professor, Ionian University  
**Botsiou Konstantina**, University of Piraeus  
**Chatzigrigoriou Pavlos**, PhD, National Technical University of Athens  
**Chroni Christina**, Assistant Professor, Harokopio University of Athens  
**Colantoni Andrea**, Associate Professor, University of Tuscia  
**Costarelli Vasiliki**, Associate Professor, Harokopio University of Athens  
**Dimelli Despina**, Associate Professor, Technical University of Crete  
**Doukas Yannis**, Assistant Professor, National and Kapodistrian University of Athens  
**Economou Agisilaos**, PhD, National Technical University of Athens  
**Gospodini Anastasia-Aspasia**, University of Thessaly  
**Halkos George**, Professor, University of Thessaly  
**Hondroyiannis Georgios**, Professor, Harokopio University of Athens  
**Kalantonis Petros**, Professor, University of West Attica  
**Kaldis Panagiotis**, Professor, University of West Attica  
**Karagiannis Stephanos**, Professor, University of Central Greece  
**Katsaiti Marina-Selini**, Professor, Agricultural University of Athens  
**Katsioloudes Marios**, Professor, The American University of Cyprus  
**Klabatsea Irene**, Associate Professor, National Technical University of Athens  
**Konstantinidou Elena**, Associate Professor, National Technical University of Athens  
**Korres George**, Professor, University of Aegean  
**Kostakis Ioannis**, Assistant Professor, Harokopio University of Athens  
**Kottaridi Constantina**, Professor, University of Piraeus  
**Kouri Maria**, Assistant Professor, University of Peloponnese  
**Kyvelou-Chiotini Stella Sofia**, Professor, Panteion University  
**Lalenis Konstantinos**, Professor, University of Thessaly  
**Loisia Pantelitsa**, Phd, EnviTech, Cyprus  
**Malindretos Georgios**, Associate Professor, Harokopio University of Athens  
**Manola Maria**, Associate Professor, University of West Attica  
**Mariotti Ilaria**, Associate Professor, Politecnico di Milano  
**Merantzas Christos**, Associate Professor, University of Patras  
**Mitoulas Nikolaos**, Phd, National Technical University of Athens  
**Moraitis Konstantinos**, Professor, National Technical University of Athens  
**Nikolaou Ioannis**, Professor, Democritus University of Thrace  
**Nosova Bogdana**, Associate Professor, Taras Shevchenko National University of Kyiv  
**Panetsos Georgios**, Professor, University of Patras  
**Papagrigoriou Aristeidis**, Associate Professor, University of West Attica  
**Papavasileiou Angelos**, Phd Harokopio University of Athens  
**Parthenios Panagiotis**, Professor, Technical University of Crete  
**Patargias Panagiotis**, Em. Professor, University of Peloponnese  
**Petroutsatou Kleopatra**, Assistant Professor, Aristotle University of Thessaloniki  
**Plotnic Olesea**, Professor, Moldova State University

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**Psycharis Yannis**, Professor, Panteion University  
**Radoglou Kalliopi**, Professor, Democritus University of Thrace  
**Rodi Alcestis**, Professor, University of Patras  
**Salvati Luca**, Professor, Sapienza University of Rome  
**Samaras Nikolaos**, Lecturer, University of Thessaly  
**Sapountzaki Kalliopi**, Professor, Harokopio University of Athens  
**Sarantakou Eythymia**, Assistant Professor, University of West Attica  
**Sardianou Eleni**, Associate Professor, Harokopio University of Athens  
**Sdrali Despoina**, Associate Professor, Harokopio University of Athens  
**Skoultzos Sofoklis**, Assistant Professor, Harokopio University of Athens  
**Stefanou Joseph**, Em. Professor, National Technical University of Athens  
**Theodoropoulou Helen**, Professor, Harokopio University of Athens of Athens  
**Touliatos Panagiotis**, Professor, Frederick University  
**Tsagarakis Konstantinos**, Professor, Technical University of Crete

### **EROS AND THE CITY: MAKE THE CULTURAL URBAN-SCAPE FLOURISH!**

DOI: 10.26341/issn.2241-4010-2025-10a-1-K02144

**Dr. Moraitis Konstantinos**

*Professor Emeritus N.T.U.A.*

[mor@arsisarc.gr](mailto:mor@arsisarc.gr)

#### **Abstract**

We shall present ‘Eros’, as a metaphor of our need and desire to encounter others and, moreover, as a metaphor of an instinctive force that social ethics and social morality continuously attempt to control. Nevertheless, despite this controlling effort, new desired drives emerge, challenging social controlling indications.

In our text, the title ‘Eros and the City’ seems provocative enough. However, what is even more provocative than the reference to the bodily contact may be the comment that besides your or others’ top-down restriction, bottom-up desires will attempt to ‘flourish’, definitely. It was in the late 19<sup>th</sup> century that Charles Baudelaire described in his *Les Fleurs du Mal*, his erotic gaze to a seductive lady, in the Parisian urban context of important cultural and political transformations. Were his political aspirations, his political ‘Eros’ more important than his love fantasies? It is in central Athens that a contemporary Greek composer sees his own female image of attraction, “αυτήν που περνάει – the one passing by”; she makes the neutral Athenian streets blooming. I could probably ask for a real garden embellishment of the urban-scape, or for the ‘blooming’ of the collaborative osmosis of the citizens.

In comparison to the previous poetic descriptions, I prefer to insist on the most impressive metaphor of erotic urbanity, on our love for our city itself, or, on our effort for the cohesion of the urban population as presented in three examples:

- a collaborative urban formation of transcultural coexistence in a student’s project under the title Plato’s Gardens,
- a ‘post-processual’ historic itinerary from Kerameikos ancient cemetery to the Islamic temple of Eleonas, and finally,
- a proposed hybrid guided visit of cultural and political narratives, in the twin central squares of the Kaisariani municipality.

**Keywords:** Eros, city and cultural urban-scape, ‘erotic’ urbanity, bottom-up, top-down, urban coexistence, transcultural coexistence, collaborative urban gardening.

## PROCEEDINGS

---

### **An introductory comment:**

The following text was presented as a conference lecture on February 14<sup>th</sup>, on St. Valentine’s Day. Nevertheless, at the time that the subject of the text and its title were decided the author did not know about the exact date of its presentation. Was it a strange coincidence?

### **Eros as a general metaphor of our need to encounter others**

Is this a poetic approach or a scientific one? We shall return to this question at the end of our presentation.

We shall present ‘Eros’, as a metaphor of our need and desire to encounter others and, moreover, as a metaphor of an instinctive force that social ethics and social morality continuously attempt to control. Nevertheless, despite this controlling effort, new desired drives emerge, challenging social controlling indications. Is ‘open-air’ urban-scape the par excellence space for the expression of social common desires? ***‘Open-air’, terms associated with the subject of the conference in which this text was presented, terms associated with the extended public urban identity.***

In our text, the title ‘Eros and the City’ seems provocative enough. However, what is even more provocative than the reference to the bodily contact may be the comment that besides their or our top-down restriction, bottom-up desires will attempt to ‘flourish’, definitely. It was during late 19<sup>th</sup> century that Charles Baudelaire described in his *Les Fleurs du Mal*, his erotic gaze to a seductive lady, “à une passante – to a passer-by lady”, in the Parisian urban context of important cultural and political transformations (Baudelaire, 1861 – Benjamin, 1955 & 1994). Were his cultural and political aspirations, his cultural and political ‘Eros’ more important than his love fantasies (Bataille, 1990: pp. 43-45)? Were those erotic fantasies projected in the seductive urban environment of the Parisian arcades, during his poetic “flâneries”, his leisurely poetic stroll – during his leisurely walk in the ‘porosity’ of the city?

It is in the context of an analogous urban phantasy, in the center of Athens that a contemporary Greek composer sees his own female image of attraction, “αυτήν που περνάει – the lady passer-by”, probably in correlation to the previous Beaudelaire’s poetical description; she makes, according to him, the neutral Athenian streets ‘blooming’; or the Athenian streets are not neutral anymore. What invigorates the composer’s erotic gaze, is the intensity of urban life, in relation to a part of the city full of commercial stores and coffee shops, at the vicinity of active academic buildings, where the passing-by young lady, a university student at the School of Philosophy, is directed. I could probably ask for a real garden embellishment of the urban-scape or is it even more interesting to ask for the ‘blooming’ of the citizens’ conduct in general, for collaborative osmosis of the citizens, in the ‘open-air’ part of the city.

---

**Img. 1:** Charles Baudelaire described, in his *Les Fleurs du Mal*, his erotic gaze to a seductive lady, “à une passante – to a passer-by lady”, probably in the context of the Parisian arcades - “The deafening street roared on. Full, slim, and grand... A woman... Noble and swift, her leg with statues matching” (upper line of images). In an analogous context, the Greek rock musician, singer, and songwriter Phoebus Delivorias, describes his own erotic urban fantasy (bottom image).

### The space and social ‘porosity’ of the city

Let us move from the terms ‘open-air’ to the term ‘porosity’, as introduced by the middle 20<sup>th</sup> century German intellectual Walter Benjamin, ‘Porosität’ in its initial German application, is etymologically correlated with the Greek words ‘porodis – πορώδης’ and ‘poros – πόρος’. In materials science, a porous medium or a porous material is a material containing pores, voids. In Benjamin’s theoretical approach ‘porosity’ may also describe the voids existing in the city formation, voids among the buildings or even voids in the interior of them being in immediate conduct with the exterior ‘open-air’ city. Analogous ‘porous’ city-scape formations as those noticed by him during his visit to the Italian city of Naples (Demetz edit., 1986), may offer to the city life intense conduct among the citizens, by corroding the barriers between secluded privacy and social life. It is the same result that Benjamin attributed to the porous formations of the commercial arcades, ‘les passages couverts’ in French, characteristic of many important Western cities (Benjamin, 1997 – Buck Morss, 1991 - Moraitis, 2024: pp. 305-367). Though strongly related to commercial needs, the arcades created a positive urban environment, an important urban cultural landscape, an important urban-scape, ‘open’ to passers-by and protected in the same time. An open and protected urban environment, characterized by ‘la fantasmagorie’, the phantasmagoria as a crystallization of collective desires and phantasies, motivated by the illusionary halo of commercial promotion.

---

**Img. 2:** On the right, the ‘porous’ quarters of Naples. There, Asja Lācis (upper left) and Walter Benjamin (left down) firstly conceived the importance of urban porosity.

Commercialized or not, the urban porosity seems to me an important quality of the city, not solely a material quality but rather, as Benjamin described it in correlation with Naples, a social quality, a quality related to the social conduct, thus culturally and probably politically crucial. A cultural quality that could be considered as socially important in general, even outside its commercial appropriation; or to use a better statement, a cultural quality whose general social importance is exploited by commercial promotion.

In 2010, working on a research program concerning the Central Areas of Athens and Piraeus and more precisely their cultural landscape and their environmental upgrading, we decided to work on the approach of the Athenian porosity, firstly analyzing the continuity of the open spaces, and the arcades or the covered walkways of the city <sup>1</sup>. Then we decided to focus on a specific type of urban porosity, using the terms ‘green porosity’, and insisting on a proposal for a Landscape Network, in the Metropolitan Territory of Athen. We could thus go back to an initial 19th century approach characterized by the famous American landscape architect Frederick Law Olmsted, under the description “Emerald Necklace”; needless to explain that emeralds are precious stones of green color. Olmsted’s emerald necklace, proposed in the general context of the 19th century ‘park movement’, referred to the territory of Boston, insisting on the central concept that park, park ways or ‘green corridors’, constitute

---

<sup>1</sup>The proposal presented was elaborated as part of the research program “Changing Characters and Policies in the Center of Athens and Piraeus”, a program assigned to the School of Architecture NTUA, by the Hellenic Ministry of Environment, Energy and Climate Change (scientific responsible prof. P. Tournikiotis, Athens 2010-2011). In this context the author, in collaboration with architect S. Mouzakis, principally investigated the network of the open-air parts of the city, in the central urban area of Athens and, in addition, the possible plantation ‘green’ network in the Athenian metropolitan territory.

a democratic right of the urban citizens (Chadwick, 1966 – Beveridge & Rocheleau, 2005: 96-108).

**Img. 3:** Porosity in the metropolitan area of Athens: the continuity of the open-air urban places and their correlation to the interior of historic and important building complexes.

**Img. 4:** ‘Green Porosity’ in the metropolitan area of Athens.

Eros, according to ancient Greeks was “the first among the gods - πρώτιστος... θεών... πάντων”, as described by the pre-Socratic Greek philosopher Parmenides, in a fragment of his poem “On Nature – ΠερίΦύσιος” (Karagiannis, 2019: pp. 43-44). “Of all the gods, firstly

---

Eros was contrived”, the one participating to the formation of every existence, the one who initially fertilized nature helping “the earth, and the sun, and the moon, and the sky that is common to all, and the Milky Way, and the outermost Olympos, and the burning might of the stars (helping all those substances to) arose”.

Surely, Eros also invigorated the existence of human communities, driving humans to embrace each other. In closer to us presentations, Eros strongly evolves in urban context, in the porosity of the cities, in the porous urban context of Naples, where Benjamin firstly impressed by the social importance of the ‘open-air’ parts of city, in its porous correlation with built structure, in the porous correlation seductively described in the well-known film by Vittorio de Sica “Yesterday, Today, Tomorrow - Ieri, Oggi, Domani”, a film with Sophia Loren, and Marcello Mastroianni. You may find analogous reference of erotic fragrance and intense community contact in a film of Greek neo-realism, under the title “A neighborhood named Dream – Συνοικία το Όνειρο”, by Alekos Alexandrakis (Moraitis 2024, pp. 316–318). An intense community contact, existing in the poor neighborhoods of the past, nevertheless lost in the richer, nowadays urban context.

**Img. 5:** Upper image, “Yesterday, Today, Tomorrow - Ieri, Oggi, Domani”, a 1963 film by Vittorio de Sica, with Sophia Loren, and Marcello Mastroianni; Italian neorealism in the ‘porous’ quarters of Naples, where Lācis and Walter Benjamin firstly conceived the importance of urban porosity. Bottom images, neo-Hellenic, post-war Athenian social and erotic porosity: “A neighborhood named Dream”, by Alekos Alexandrakis.

Is erotic desire an important part of human behavior? Is it an important part of human nature to live in communities? Is it this, communal existence, an important expression of human nature? As a consequence, is urban landscape important for human communities, for communal human nature that there, this communal human nature, may be ‘planted’ and ‘germinate’, in the open-air parts of the cities and in their correlation to the porous build environment? Trying to respond to this aporia we shall present a proposal for the formation of a complex of collective self-managed gardens, under the name *“Plato’s Gardens”*, at the territory of Plato’s Academy, a complex of collective self-managed gardens organized on the principles of Permaculture <sup>2</sup>. Let us explain that *“Permaculture”* is an approach to land

65

---

management and settlement design that adopts arrangements observed in flourishing natural ecosystems. It includes a set of design principles using *whole-systems thinking*. *It applies these principles in fields such as regenerative agriculture, town planning, rewilding, and community resilience.*

**Img. 7:** General masterplan describing the proposal of Plato's Gardens. Winery (1), open-air market dedicated to the sale of the Gardens' products (2), installations of experimental hydroponic horticulture (3), pre-existing archeological site (4), vegetable gardens (5), greenhouses (6), vineyards (7), fruit gardens (8), educational vegetable garden (9), zone at the periphery of the site dedicated to olive trees (10).

The term 'Permaculture' was coined in 1978 by Bill Mollison and David Holmgren, who formulated the concept in opposition to modern industrialized methods, instead adopting a

## PROCEEDINGS

2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025

---

more traditional or close to nature approach to agriculture. Let us insist on the remark that the term ‘permaculture’ may refer to the ‘*per*-manent agri-*culture*’, as well as to the “*per*-manent human *culture* in general”. We have previously described permaculture as a whole-systems way of thinking, associated with community resilience. ***It is thus a matter of eco-productive as well as of socio-cultural demand. Its correlation to an important cultural- archeological territory, such as Plato’s Academy, may be considered extremely stimulating.***

***The general masterplan of the proposal for Plato’s Gardens describes several possible functions. An openair market dedicated to the sale of the Gardens’ products, installations of experimental hydroponic horticulture, a pre-existing archeological site, vegetable gardens, greenhouses, vineyards and a winery associated to them, an educational vegetable garden, fruit gardens and finally a zone at the periphery of the site dedicated to olive trees. Moreover, Plato’s Gardens constitute a promenade area for the inhabitants of the nearby neighborhoods, as well as an area of trans-local importance correlated with the archeological site of the nearby Plato’s Academy.***

### A first ‘Symposium’, of Collaborative Permaculture in Plato’s ‘Khôra’

In Plato’s dialogue *Symposium* (Plato 2013 & 2018), Eros is recognized both as an erotic reference and as a phenomenon capable of inspiring courage, valor, great deeds and works, and vanquishing man's natural fear of death. It is seen as transcending its earthly origins and attaining spiritual heights. I shall not dare to propose feasts like the one depicted by Anselm Feuerbach, presented in our text. I may, nevertheless, propose in a much more modest way continuous community coexistence, a love of community coexistence, correlated with the ‘cultivation’ of social values. *More precisely, in the case of Plato’s Gardens, or in Plato’s ‘Khôra’<sup>3</sup> we may refer to community coexistence that may bring together citizens of different ethnic, cultural and religious identities as those living today, side by side, in the territory of Plato’s Academy.*

**Img. 9:** Plato's *Symposium*, as depicted by Anselm Feuerbach (1869). Symposium, a banquet where the participants were drinking the precious wine of ancient Attica; precious wine as the one which could probably be produced in the winery of the promising Plato’s Gardens.

---

<sup>3</sup> ‘Khôra’ (also ‘chora’; ‘χώρα’ in [Ancient Greek](#)) is the space that gives a place for [being](#). The term was used by [Plato](#) again, in another dialogue of his, [Timaeus](#), to designate a receptacle, a formless interval, alike to a [non-being](#), in between which ‘[Forms](#)’ were received from the intelligible realm and were shaped into the transitory forms of the sensible realm ([Πλάτων](#), 2014: 48e4).

## PROCEEDINGS

2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025

---

**Img. 10:** Or, instead of a symposium dedicated to the philosophical approach of Eros, we could expect cultural activities, presented in the context of a garden environment. In an analogous context, the ancient Thespis' Chariot gave historical birth to the cultural performance of Eros, to the theatrical praxis, in the agricultural periphery of ancient Athens. *Thespis' Chariot*, by Gustav Klimt (Burgtheater, in Vienna).

Let us insist on the last part of our sentence: *community coexistence that may bring together citizens of different ethnic, cultural and religious identities as those living side by side, in the territory of Plato's Academy*. Could we insist on this multicultural coexistence? To this aim is also dedicated the next project to be presented, a 'post-processual'<sup>4</sup> historic itinerary from Kerameikos ancient cemetery to the Islamic temple of Eleonas, in Athens.<sup>5</sup>

---

<sup>4</sup> 'Post-processual': Correlated with non-ordinary, conventional proposals of the 'supposedly' objective (nevertheless ideologically pre-determined) archeology. "Post-processualists suggest that we can never confront theory and data; instead, we see data through a cloud of theory" (Johnson 1999, p. 102).

<sup>5</sup> The proposal was presented as a post-graduate diploma project, by architect Doito Bonotulshi, under the title "Introducing the Multi-temporal and Multicultural notion of space from Kerameikos to Academy of Plato". It was achieved under the didactic guidance of prof. K. Demiri and K. Moraitis in the School of Architecture NTUA (acad. year 2021-2022), in the context of the Erasmus Plus Joint Master Course "Architecture-Landscape-Archeology" (organized by the Sapienza Univ. of Rome, the National Technical Univ. of Athens, the University of Coimbra and the University of Naples).

## PROCEEDINGS

---

**Let us insist on the correlation between Hellenic and Islamic civilization: a second ‘Symposium’ of cultural and political dialogue, focused to the positive coexistence of different ethnic groups**

In Ancient Greece the symposium (*sympósion* or συμπόσιον in Ancient Greek language) was the part of a banquet that took place after the meal. The participants were drinking together, but they could also discuss serious subjects, like those related to philosophical approaches. It is in this context that Plato’s *Symposium* was dedicated to a philosophical dialogue and that, in modern usage, the term has come to mean an academic or scientific conference, a serious dialogue of cultural value. A wine-drinking banquet could probably be alien to the Islamic habits, nevertheless a cultural and political dialogue could be extremely important, for both sides, westerners, Greeks in our case, and people of Islamic origin.

It is common for a big part of the Western population, to refer to the controversial relations between their own civilization and the Islamic East, or to interpret the latter in a distorted ‘orientalized’ way. A different way of approach could signalize the important influence of it to the Europeans, during an extended medieval period, through important intellectuals, mathematicians and physicians, through their Arabic libraries of the medieval Spain and, in relation to a sensitive landscape approach, through their delicate design as those in the case of the Arabic gardens of Alhambra.

Analogous cultural correlations may be described in the case of the Byzantine civilization, in its contact with the adjoining Arabic populations and, through this conduct in its intimate approach of the Arabs with Hellenic references in general. We may guess that Plato’s *Symposium* could not be easily accepted by Islamic communities of the past and the same is rather true for the Islamic communities of the present day. Nevertheless, a great number of ancient Hellenic canons were saved by Arab scholars, who were especially interested in the Neoplatonic philosophy. The Arab dynasty of the Abbasids was interested in reorganizing the middle-ages Bagdad in a circular form, in accordance with the Plato’s description of the Universe, and Sinbad the Sailor in one of his legends imitated Ulysses’ ruse in order to be saved by a monstrous cannibal similar to the Homeric Polyphemus. The most important legendary hero of the Byzantine era, The Border Lord, is a fearless warrior of double origin, son of a Christian Byzantine mother and an Arab war lord. The construction of his villa and garden in the Euphrates River territory, described in a 12<sup>th</sup> century folksong, precedes the Tuscan Medici’s villas and gardens for two centuries (Moraitis, 2018).

**Img. 11:** Focus Areas – Kerameikos, Plato’s Academy, Votanikos Mosque and the proposed Nodal Points. Emblematic structures – ‘folies’, installed on focal places could signalize the continuity of the visiting itinerary and could offer, to visitors and inhabitants of the city, guiding didactic narratives in hybrid form, written notes and digital guidance.

*The diploma project presented insists on the previous context.* It refers to the formation of a visiting itinerary, connecting the territory of the ancient cemetery of Kerameikos, in Athens, with the newly established mosque in the territory of Votanikos, through the archaeological site of Plato’s Academy. The project according to its own description “attempts to create interaction spaces between heterotopic enclaves”, those of the archaeological sites, the mosque’s site and the nearby quarters of the housing of immigrants; many of them are of Islamic origin. “These (heterotopic) spaces are politically aware, mnemonic, and create an opportunity of sensorial inquiry that offers engagement with multi-temporality”, with multiculturalism and multi religious approach as well, “as opposed to a disinterested and ‘objective’ reconstruction of a selected past”.

The main goal of the research was to enhance the relationship between Greek locals and Arab immigrants, to re-evaluate and democratize the archaeological remains as multicultural and multitemporal spaces. It attempted, firstly, an ethnographic study, to record the social life of the modern inhabitants. Through this analysis, the research aimed to create a dialogue and a

---

holistic narrative relatable to the differentiated ethnic references: the classical Greek, the contemporary urban practices and the post-migration imaginary of the immigrants. The second objective of the project was the integration of open-air places, as urban activity generators, which would provide equal opportunities for communication and expression for the different groups of inhabitants.

**Img. 12:** Charbagh (Four- Square) Garden as described in traditional Islamic tapestry or in micrographs (upper images) and its formal schematic analysis (bottom images).

The design strategy begins with an analysis of a path that can be used as backbone for the narrative to continue from Kerameikos to Votanikos Islamic Mosque area. The thematic path is characterized by a set of nodal points which have been selected based on a previous thorough contextual and historical analysis of the focus area. Emblematic structures – ‘folies’, installed on those focal places could signalize the continuity of the visiting itinerary, and could offer, to visitors and inhabitants of the city, guiding didactic narratives in hybrid form, written notes and digital guidance. Finally, the thematic path arrives at the newly created Islamic Mosque in the territory of Votanikos. There, the open-air public space, in front of the

---

Mosque, was composed in reference to the four squares formation of the Islamic Garden, as described in the traditional tapestry or in micrographs of analogous depictions. The central idea of the project was thus declared in the optimum possible way. ***Islamic and Hellenic cultures may co-exist, side by side as in the depiction of Raphael’s “The School of Athens”. There, among the important ancient Greek philosophers, the Arab intellectual Averroes is presented, side by side with Pythagoras.***

**Img. 13:** Votanikos Mosque Garden composed, according to the previously presented principles of the Islamic Garden Design (on the left) - Averroes and Pythagoras as depicted by Raphael in the famous fresco of *The School of Athens*, in Vatican (on the right).

### **An erotic Saturday night at the Athenian symbiotic municipality of Kaisariani**

We finally arrived at the third project presented in our text. It insists, as the two previous proposals suggest, on several contemporary social, cultural, and political demands concerning urban co-existence. Nowadays, the need for landscape urbanism and urban environmental sustainability is quite evident. Nevertheless, such an ‘ecosophical’ approach could not be successful, but only under a simultaneous social and political contribution based on democratic extended participation. Insisting on this final term, ‘participation’, we may reach a second important, contemporary urban condition already described in our text: the recognition, already previously presented, that urban populations, in most contemporary cities, in the majority of them, are not uni-cultural. On the contrary, mixed urban communities of differentiated ethnic, cultural, and religious identities must co-exist, living in the same urban realm, often featuring contradictory interrelations. It is in this context that we insist on the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

terms ‘eco-social sustainability’: our societies could not survive or claim their natural existence, their natural sustainability, unless in correlation to their social sustainability. The principal ecological quality of social formations has to do with their social quality. The evaluation of their natural context of existence seems to be intrinsically associated with their political and ethical integrity, even if this demanded integrity is not the result of a passive stabilized tranquility. It is rather the result of an energetic mutation of the social formations, of their ability to infiltrate historic social transformations and, more precisely, in correlation to contemporary reality, to be able to accept their multicultural approaches and evolve. In a meta-Darwinian description, societies that may accept and positively incorporate unavoidable changes of their social environment, would be ‘the fittest to survive’.

### **‘Hybrid’ urban place as a combination of real and virtual urbanity**

*We have reached again the central object of our presentation, the importance of the urban public domain as par-excellence place of social communication. It is in this same public common environment that we may create the most attractive conditions for a positive dialogue, among differentiated urban communities.* Nevertheless, one of the most crucial problems of this desired communication, has to do with the functional differences of spoken and written languages and, furthermore, of differences concerning the educational background and the differentiated cultural concern, among groups of different ethnicity, religion, and age. *In which way could we facilitate and ensure positive contact among all these different groups, using different languages and means of communication?*

Could hybrid guidance, in real and digital space, contribute and facilitate our urban co-existence? Digital response to our questions could offer a possible multi-formal solution, using many parallel narratives as answers to our urban anxiety. We could thus dream, for example, of a real urban public place of communication, a real urban square co-existing with a virtual condition of publicity and, moreover, we could design real urban public place – ‘real urbanity’ together with the proposed ‘virtual urbanity’. *We could thus propose a holistic approach to ‘hybrid’ urban public place, to ‘hybrid urbanity’.* Such an approach was used in the project for the rehabilitation of the central public squares of Kaisariani<sup>6</sup>, in the homonymous municipality in the metropolitan area of Athens. The case study seems to be extremely interesting, because of the specific cultural and political identity of the site.

---

<sup>6</sup> The project presented was the result of the collaboration of the Arsis Architect’s Design Team with the Technical Service of the Municipality of Kaisariani (end of the study, 2022). The author participated to the Arsis Architects’ design team, together with the architects A. Chelidoni, V. Kolikai and R. Bakopanou. Unfortunately, the project had not materialized in its initially proposed form.

### **‘Hybrid’ public contact in the central squares of Kaisariani; a dialogue between urban groups of differentiated ethnicities, of immigrants and refugees of past and present**

**Img. 16:** 1922 - the seaside of the city of Smyrna at the Minor Asia coast, full of Greek and Armenian inhabitants, trying to save themselves. The world was going up in flames, but those flames were not new to our dead and, moreover, they were not the last to burn our hopes. Warfare, environmental and economic destruction will not stop driving populations to exile roads.

The contemporary municipality of Kaisariani, was created on the place of a refugee camp, formed in 1922, to house refugees from the Greek cities of Minor Asia; refugees that were trying to survive under conditions of extreme poverty. Later on, the first built structures were produced and a municipality at the periphery of Athens was created. Nevertheless, the important historic adventures of the territory did not stop. During the Second World War the installations of the Rifle Range, existing in the municipality of Kaisariani as an athletic center, were used by the Nazi forces occupying Greece as an execution place. There on the 1st of May 1944, two hundred members of the Hellenic Resistance were shot; we refer to an incident able to inscribe its place of reference in the historical and political memory of the world.

In addition to the previous historical references, Kaisariani municipality was characterized by a third important association, a cultural one, regarding neoteric Hellenic folk-culture. Rebetico song is a cultural production, created after 1922, by refugees of Greek ethnicity, arriving in Greece, from their initial places of millennia's-long installation in Minor Asia. The refugees brought their musical modalities and singing traditions of Asiatic cultures. Then mixed those ancestral approaches with the folk music of the Greek mainland inserted in the industrial territories of the big Greek cities by the internal immigrants, arriving there in search of work. Reputed as such a testimony is a place in Kaisariani, strongly correlated with

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Rebetico song; the tavern ‘Χώραμα - Dawn’ in Greek, where famous Rebetico composers, bouzouki players and singers appeared.

In the case of Kaisariani, it would be a promising possibility to correlate all previous references with the everyday life of citizens, harmonizing everyday amusement or regular everyday public contact, with a promising navigation in the turbulent ‘sea’ of the cultural and political identity of the place. It could also be extremely invigorating for the immigrants and refugees that reached Athens during the previous decades, to be reminded that their recent to us historic-political adventures are not isolated in the history of Europe, especially in the Eastern Mediterranean territory, and that the Greek population of Kaisariani was partly created by analogous previous historic incidents. Thus, we ought to insist not on contradictions among differentiated historic identities, but on the similarity of historic events that reformed, in the past, indigenous culture through mixing and juxtaposition, through cultural osmosis. Being historically precise, we must accept that culture in general is the result of analogous osmotic symbioses, ‘erotic’ symbioses in our allegorical description, and that such a condition will undoubtedly continue in the decades to come. Warfare, environmental and economic destruction will not stop to drive populations to exile roads, and the acknowledgment of this reality is of utter importance for the indigenous citizens in our countries and newcomers as well, in Europe and in the entire world.

**Img. 17:** Correlating a possible night out at the Kaisariani square as presented in the above 3D presentation, with a famous Rebetico song under the title ‘Saturday night in Kaisariani’; a song with both political and erotic references – *could the death, the execution, efface the seduction, the warmth of his eyes?* On the contrary, according to Plato’s *Symposium*, Eros may vanquish human's natural fear of death...

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### **Creating a map of cultural and political guidance**

The floor level of the Kaisariani square was designed based on the previously presented approach, reproducing the map of the eastern parts of Mediterranean, describing the eastern Isles of Greece and the west coastline of Turkey. Metallic plates would be inlaid on the places of the map where important urban settlements of the past flourished, or present cities exist; metallic plates with QR codes inscribed on them. Passersby could be attracted by the plates and QR codes and be invited, through digital navigation, to several differentiated narratives. That being so, we chose to insist on the exemplary historic incident that we already previously mentioned, on the 1922 extended genocide and forced immigration of Greek and Armenian refugees from Minor Asia, which decisively influenced Hellenic history, the political, cultural, and urban history of modern Greece. Evidently it was important for us to refer to a historical incident well known for our country that immediately influenced the life of our ancestors and consequently our own cultural and political feeling as well, our own cultural and political existence. We refer to a historic event, which radically transformed the 20th century Greek cities being infused by an extended number of Minor Asia refugees' quarters; a historic event which deeply influenced both the centralized urban Greek civilization and the neoteric Greek folk-culture.

Nevertheless, our effort in our proposal for the design of the Kaisariani square would prefer to use the reference to the destruction of the Hellenic part of the Minor Asia in 1922, principally as a pretext, not intended to be associated with a nationalistic approach, or to an effort to revitalize nationalistic confrontations of the past. We should like to abstain from an analogous vulgar confrontation. What we would really desire is to offer a requiem, dedicated not only to the inhabitants of the pre-destroyed Smyrna, or to the actual victims of analogous extermination, but also to the continuous massacres and urban destruction that have not ceased to exist, that continue to take place, till now, in a large part of our 'civilized' world.

### **Coming back to the 'eco-social sustainability' and multi-cultural coexistence, through our hybrid, real and 'smart' approach**

Using as an exemplary case the previous 1922 reference, we could then try to present though our virtual navigation narratives, contemporary refugees', and immigrants' movement, in the Mediterranean territory principally from Asia and Africa to southern European countries. An analogous presentation could be offered to the multiple visitors of the Kaisariani square, in many different languages that could facilitate the communication with refugees and immigrants, whose languages are not in common usage in contemporary Greece. As a next step we could then imagine multidirectional communication, incorporating in the digital data of our guidance system, the comments, criticism, and statements form the part of the multicultural, multiethnic visitors of the territory. Songs and music of multicultural origin

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

could greatly enrich the communication system and create a place reference that could attract a multiplicity of visitors.

It would be in such a communication context that the cultural validity, the socio-political echo of the place would be multiplied (Moraitis, 2023); real place itineraries and, in parallel, digital continuous navigation, ‘in situ’, in real place, as well as through distant internet navigation.

The previous ‘augmented’ possibility of multicultural and multilevel urban communication is what we would like to correlate with the key concept of the ‘eco-social sustainability’, a concept to which we would like to insist again at the conclusive part of our text. The important condition of the sustainability of our human communities has primarily not to do with the sustainability of their natural environment, but rather with their socio-political sustainability, a condition that must be considered as principal for both natural and social preservation. Urban landscape, the public urban landscape, the public urban place must be recognized as the place ‘par excellence’, where the need for our ‘eco-social sustainability’ may be performed and preserved, through the densest possible communication. It is in this context that we have insisted on a place formation, promoting historic and political memory and multicultural positive co-existence through a hybrid, real and ‘smart’ approach...

We could finally conclude the previous description, insisting on the erotic seduction of a Saturday night, a summer or spring Saturday night at Kaisariani. “Saturday night at Kaisariani”, being the title of a song with erotic and political connotations, well known to the late 20<sup>th</sup> century Greek audience.

## Epilogue

Was this a poetic approach or a scientific one? Moreover, could poetic approaches contribute to the scientific conception, if not to managerial proposals, at least to my design visualization? Does psychoanalytic theory explain not solely individual psychopathology but, in addition, cultural and even political formations? If psychoanalysis may explain the way that individual behavior is formed under the social transformation of erotic instinctual drives, then the psychoanalysis of the city would be a field of interest that would obsess me during the next few years of my life.

Plato, in his *Symposium*, describes the dialogue between Socrates and Diotima, the priestess from Mantinea. According to this dialogue, Eros equates neither to perfectness nor to imperfectness, but to the in-between condition, to the desire to move from a lower state of deficiency to a higher state of accomplishment. It principally refers to the power of desire, in our case to the desire for the positive formation of the urban communities, expressing itself in the open-air urban context.

I think I could not wait anymore... I shall dare to pronounce, NOW, the final conclusive statement of the above, promising, future theoretical expectation of mine.

---

Although Freudian psychoanalysis focuses on the predominance of the erotic libidinal instinct, eroticism is not crucial because of its hedonistic orientation principally. It is rather important because it seems to be an instinctual force, which could easily be controlled, thus ‘educating’ immature young humans to accept the imposition of societal ethics and morals. It is thus a ‘politically’ crucial, constitutive blind force that has to be formed through the enforcement of societies. Surely, individuals or even parts of the involved communities may react, and the controlling pressure may be transformed and even collapse. An analogous theoretical approach was suggested by Herbert Marcuse, in his book on *Eros and Civilization* (Marcuse, 1998); not ‘Love and Civilization’ but going back to the ancient Hellenic term ‘Eros and Civilization’. ***What our proposal suggests in addition is that the important place formation where this controlling procedure or its bottom-up denial occurs is urban place in general and in an even more exact indication, the open-air part of the city.***

# ADVANCING CONSUMER PROTECTION THROUGH THE CIRCULAR ECONOMY: STRATEGIC IMPERATIVES OF REDUCTION, REUSE, AND REPAIR

**Plotnic Olesea**

*Chair Action ECO4ALL, Full Professor of Moldova State University, Republic of Moldova*  
[plotnicolesea.aum@gmail.com](mailto:plotnicolesea.aum@gmail.com)

## Abstract

The transition from a linear to a circular economy is essential for enhancing consumer protection, reducing environmental impact, and promoting sustainable development. This paper investigates the strategic imperatives of reduction, reuse, and repair within the circular economy, focusing on their role in safeguarding consumer rights and fostering sustainable consumption. As part of the EU Circular Economy Network for All (ECO4ALL) COST Action, this study addresses existing gaps in understanding and implementation by emphasizing consumer empowerment through sustainable practices.

The research examines the legal, economic, and social dimensions of circular economy strategies that involve consumers in sustainable practices. It highlights the current policy landscape, identifying both opportunities and barriers to implementing circular economy measures across EU and non-EU countries. The study also underscores the importance of interdisciplinary collaboration among academia, industry stakeholders, public administration, and civil society to develop innovative solutions that enhance circularity and consumer protection.

Through a comparative analysis of best practices across various countries, this paper provides insights into optimizing circular economy efficiency, particularly in terms of consumer education and behavior change. The findings demonstrate that a proactive consumer role in the circular economy is crucial for achieving the EU's goals of sustainability, climate neutrality, and economic resilience by 2050.

Ultimately, this paper contributes to the ongoing discourse on the circular economy by integrating consumer protection as a fundamental component of environmental and economic policy. It offers practical policy recommendations and strategies for researchers, policymakers, and industry stakeholders to advance sustainable development through a circular economy that works for all.

**Key words:** circular economy, consumer protection, sustainable development, reduction, reuse, repair, policy recommendations, comparative analysis.

## Abstract

Circular economy is the new economic model which is intended to hopefully replace the still prevailing linear economy one, described as “take, make, dispose”.

The aim of the circular economy is to reduce the environmental, climate and energy footprint of any human activity to preserve the resources of the planet and their overexploitation. Key resources of the planet, such as the critical raw materials, are instrumental for the energy transition as they are needed for eco-innovation, AI, RES, energy storage and electromobility. They need to be managed efficiently and recovered from waste containing them.

Circular economy is not only reuse and recycling of waste or wastewater. It is to be conceived holistically to cover all the sectors of the economy and to be mainstreamed in all of them. It requires circular economy plans both vertically and horizontally. From the national to the local level - we should be speaking about « circular city » - and in the business sector, as circular entrepreneurship and Circular ESG, C-ESG.

Circular economy is a new narrative and a new culture. We have one planet that we need to protect in the framework of the Sustainable Development, the SDGs, the Green Deal, the UNFCCC and the Paris Agreement. Circular economy becomes instrumental in serving all the above and is also a key element of the Taxonomy Regulation of the EU on Green projects and Green financing.

It is the « umbrella » of Green growth, Blue economy and Digital economy and as such it will boost the Green transition and by reducing substantially the emissions, enable us to reach climate neutrality by 2050, while protecting the environment, biodiversity and ecosystem services which are vital for the planet.

**Key words:** circular economy, ESG, energy transition, net zero.

## Introduction

The planet is currently facing several challenges due to different causes, which often interact and lead to a spillover effect. The major one is climate change which has reached a critical level and is thus referred to as climate crisis, combined with the energy crisis, exacerbated by the wars, a food crisis, risks of pandemics and health related risks, and with a new flow of

## PROCEEDINGS

---

migration due to the wars, to the climate impacts and to political instability and human rights violations in different parts of the globe. All the above are exacerbated by the overpopulation problem the planet is confronted with, which exceeds its carrying capacity and undermines the needs of the current and *a fortiori* the future generations. The circular economy as the new economic model is the only one that can preserve the resources of the planet, ensure resource efficiency, protect its environment and the quality of life, and preserve biodiversity and the ecosystem services that the green capital of the planet is providing. As it contributes significantly to the reduction of greenhouse gases and of pollution, it constitutes the key driver of the energy transition towards carbon neutrality.

### **I. The Circular economy concept**

Circular economy is the new generation economic model aiming at progressively overriding the still prevailing linear economy one, described as "take, make, dispose", in other words use resources that are often scarce to produce products which have a short life cycle, are not repairable and become rapidly waste, are difficult to reuse, valorize or recycle. Often those products have a high environmental, climate and energy footprint and in certain third countries are produced in violation of CSR and ESG patterns which do not institutionally exist there.

As the environment has no borders, any human activity that leads to pollution or uncontrolled emissions of CO<sub>2</sub> and methane affects the quality of the environment of the planet, its biodiversity and boosts the climate crisis. Circular economy in its holistic concept can clearly reduce the environmental, energy and climate footprint of any human activity with the view to preserving the resources of the planet, their sustainability and reduce their overexploitation. It promotes resource efficiency by using less, in a more selective manner, resources, reintroducing resources into the economy through reuse, recycling, industrial symbiosis and waste to energy processes.

Key resources of the planet, such as the critical raw materials and rare earths are instrumental for the energy transition as they are needed for eco-innovation, AI, Renewable energy sources, energy storage, carbon capture storage and electromobility. They are also instrumental for the development of the *Net Prosumer* concept, from the words energy producer and energy consumer also in a net metering framework, which in practice encourages the production of RES by companies or households, mainly through solar panels and batteries storage of the energy produced during the day to be used during the night or sold to other entities or back to the grid, using digital and AI devices.

Circular economy *lato sensu* has started as a sound waste management model, managing solid - hazardous, industrial, and municipal - and liquid waste - industrial and sewerage - as raw materials or secondary products, in a zero-waste perspective, with the view to reintroducing them into the economic cycle and avoid downstream waste management. In this context the reverse waste hierarchy pyramid is the model to follow: waste prevention, reuse, recycling, waste to energy and a minimum landfilling fraction of the residue only - 10% under the revised EU waste framework directive, by 2035.

In this context industrial symbiosis is key; it covers what is industrial waste for company A, to be taken care of under the extended producer responsibility, and enables it

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

instead to be used as a resource - raw material or secondary product - by company B and/or C, in a win-win situation. Industrial symbiosis is instrumental to promote circular economy through the development of Industrial Symbiosis Data Banks using digital economy and AI tools. As solid waste management is at the heart of circular economy, the development of the appropriate framework of the extended producer responsibility and of the other economic tools is key to serve the waste hierarchy: The *Pay as you throw* and the *Deposit Return Systems (DRS)* reduce the production of waste, encourage reuse and promote recycling, and are key for the separate collection of waste and for collection at source.

In parallel, circular economy in liquid waste - industrial and sewerage - can lead to the extraction of raw materials and secondary products, and when it comes to municipal wastewater treatment - especially tertiary - to the reuse of treated wastewater or grey water for irrigation or industrial purposes. The relevant EU legal framework is established by Regulation (EU) 2020/741 of 25 May 2020, on minimum requirements for water reuse (OJ L 177, 5.6.2020, p. 32-55). The Water Reuse Regulation (WRR) will increase the trust of consumers and farmers in this circular approach to the use of water, ensuring it is safe and reducing the pressures of abstractions on increasingly scarce water resources. It will also help preserve the water resources needed by the aquatic and terrestrial ecosystems. This is a tool to help protect biodiversity, for achieving zero pollution and adapting to climate change. This new Regulation requires that urban wastewater, which has already been treated in accordance with the Urban Wastewater Treatment Directive (UWWTD), is further treated to meet the minimum quality standards of the Regulation to be suitable for agricultural use. As water stress is exacerbated by climate change impacts, the use of this reclaimed water in agriculture can play an important role in tackling water scarcity and drought. By setting minimum quality standards, the WRR promotes the safe use of reclaimed water in agriculture and ensures the protection of human and animal health and the environment. Circularity in the use of water for increased resilience is instrumental. Good quality water in sufficient quantity is vital for the sustainable growth of European society and economy and for the protection of the environment. However, freshwater resources in EU countries are increasingly coming under pressure, leading to water stress and poorer water quality. Climate change, with its unpredictable weather patterns and more frequent and severe droughts, is contributing significantly to lower water availability. In line with the European Green Deal and the principles of the Circular Economy, water reuse for agriculture can help preserve our freshwater resources and increase our resilience to water stress by reducing the water abstraction from rivers, lakes, and groundwater.

Agriculture supports the production of food and other agricultural products necessary for the health and prosperity of European citizens. EU is the global leader of agri-food exports, employing over 40 million people. However, the EU agriculture sector is also one of the major users of freshwater resources in Europe, accounting for approximately 50% of total annual water consumption. Water demand from agriculture is highest in late spring and summer when water availability is at its lowest in many parts of Europe. Water reuse can ensure that farmers have access to a more predictable supply of clean water and help them adapt to unpredictable water availability, as well as improve resilience to climate change and mitigate its impacts. In addition, reusing water can increase investment in innovative treatment technologies and competitiveness on the market. The Water Reuse Regulation sets

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

out minimum standards to give EU citizens and businesses confidence in the quality of reclaimed water and agricultural products. It also sets out common monitoring requirements, risk management provisions for possible health and environmental risks, and ensures transparency, so that key information about any water reuse project will be available to the public. The Water Reuse Regulation is applicable as of 26 June 2023. The Regulation sets out: Minimum water quality requirements in the European Union for the safe reuse of treated urban wastewaters in agricultural irrigation; Harmonized minimum monitoring requirements, notably the frequency of monitoring for each water quality parameter, and validation of monitoring requirements; Risk management provisions to assess and address potential additional health risks to human and animals, and possible environmental risks; Permitting requirements for producing and supplying reclaimed water; Transparency, whereby key information about any water reuse project is made available to the public. The Member States have been preparing for the application of the new rules, with many choosing to integrate the new rules into relevant national laws or strategies. Some are also regulating water reuse for applications beyond agricultural irrigation. Where treated wastewater is reused for irrigation in agriculture, this has to be done in accordance with the new rules.

However, the Water Reuse Regulation allows Member States to decide not to practice water reuse in their territory or to limit the water reuse in certain areas. Some Member States, where freshwater resources are abundant and irrigation demand is low, have planned not to allow water reuse for irrigation in their countries. Other Member States have not yet made a final decision, as resource and infrastructure costs still are being evaluated.

Apart from the higher standards of the WRR, treated water can also be used for industrial purposes - cooling - and to possibly support a secondary network of water to be used for washing boats and yachts in marinas.

Finally, the dried - ideally through RES - sludge from the Wastewater treatment plants can be used for the production of compost or for alternative fuels.

As regards solid waste, the amended 2008/98/EC waste framework directive establishes ambitious reuse and recycling targets: by 2025 the preparing for re-use and recycling of municipal waste shall be increased by weight to a minimum of 55%. The target by 2030 is 60% and by 2035 65%, while by 2035 landfilling cannot exceed 10%. Only the residue can be landfilled, while there is a percentage of approximately 25% to 35% of residual waste that could be incinerated in line with the waste to energy communication. To reach those targets, economic instruments are key. The *Deposit and Refund Scheme (DRS)* and the *Pay as you throw (PAT)* in combination with the *extended producer responsibility (EPR)* are to be fully implemented as they lead to separate collection and to clean recyclables streams, avoiding thus detergents to clean the sorted waste, and additional mechanical sorting.

EPR schemes require producers to take responsibility for the entire lifecycle of their products, in particular at the end of the product's life. The level of the financial contributions of the producers will be based on the circularity and environmental performance of the products concerned.

As regards non-hazardous construction and demolition waste, the target for re-use, recycling, and other material recovery by 2020 was 70% by weight.

The most recent amendment of directive 2008/98/EC is presented in the 2023 proposal of the Commission which regulates prevention of food waste generation in primary

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

production, in processing and manufacturing, in retail and other distribution of food, in restaurants and food services, as well as in the households. The proposal foresees that the Member States shall review and adapt their food waste prevention programs to achieve by 31.12.2030 the following targets: a) reduce, by 2030, the generation of food waste in processing and manufacturing by 10% in comparison to the amount generated in 2020; b) reduce by 2030 the generation of food waste per capita, jointly in retail and other distribution of food, in restaurants and food services and in households by 30% in comparison to 2020.

The proposal also establishes an extended producer responsibility (EPR) scheme for textiles and footwear products. Under such schemes, textile producers will contribute to the management of used and waste textiles. By being responsible for the end of lifetime of the products they sell, producers will be encouraged to design longer-lasting textile products that are easier to be reused, repaired, and recycled and thus promote circular economy in the sector. In the proposal it is foreseen that Member States shall ensure by 1 January 2025 the separate collection of textiles for re-use, preparation for re-use and recycling. The first *Whereas* of the proposal refers to the Green Deal and the Circular Economy Action Plan which call for action to ensure sustainability of the textiles and food sectors as they represent top resource intensive sectors that cause significant negative environmental externalities. On 18 February 2025 a provisional agreement was reached. The amended directive will promote circular economy throughout the EU, notably by fostering innovation and moving towards more sustainable industrial and consumer practices as regards textile and food waste.

Circular economy is to be conceived *lato sensu*, i.e. in its broadest sense, covering not only solid and liquid waste, but also sustainable production and consumption patterns, Renewable energy sources (RES), electromobility, energy storage and eco-innovation. The idea is to produce new generation products which use circular economy resources, originating from recycling, have a longer life cycle, are repairable and can be easily recycled at the end of their life cycle. Important to that effect is the proposal for a Directive on common rules promoting the repair of goods and amending Regulation (EU) 2017/2394, and Directives (EU) 2019/771 and (EU) 2020/1828. This is part of the Green Deal objective of sustainable production and consumption in a comprehensive manner, combined with various other initiatives that tackle different aspects of premature disposal of goods on both the supply and demand side.

On the supply side, the Regulation (EU) 2024/1781, of 13.6.2024, establishing a framework for the setting of ecodesign requirements for sustainable products, sets the framework for product reparability at the production phase, in particular on product design requirements and the availability of spare parts. The aim is to make sustainable products the norm and to reduce the overall carbon footprint and environmental footprint of products over their life cycle. This proposal results from the Circular Economy Action Plan of 2020. The plan underlines that, for citizens, the circular economy will provide high-quality, functional, and safe products, which are efficient and affordable, last longer and are designed for reuse, repair, and high-quality recycling.

On the demand side, the proposal for a Directive (COM/2022/143 final, 30.3.2022) on empowering consumers for the green transition through better protection against unfair practices and better information, provides for better information on the durability and reparability of goods at the point of sale. This enables consumers to take informed sustainable

---

purchasing decisions. This Directive is complemented by another Commission proposal, adopted on 22.3.2023, for a Directive on new rules on substantiating green claims, which tackles false environmental claims, and the wide expansion of public and private environmental labels. The two aforementioned proposals establish a regime for environmental claims and labels with the aim of combatting greenwashing.

Another relevant proposal is the Regulation on harmonized rules on fair access to and use of data (Data Act), under which users of connected products shall have access to data they generate during their use and have the right to give such data to a third party of their choice. Such data access will be relevant for independent repairers.

## **II. Energy transition and green transition towards carbon neutrality**

Climate change and environmental degradation are an existential threat to the EU and to the world. To overcome these challenges, the European Green Deal is the new growth strategy of the EU, aiming at transforming the Union into a sustainable, resource efficient and competitive economy. The goal is to make the EU climate neutral by 2050, boost the economy through green technologies, develop sustainable industry and transport, cut pollution, and create green jobs. The road map is to reduce greenhouse gas emissions by 55% in 2030, 90% by 2040 and reach net zero by 2050. The Greek climate law foresees an 80% reduction target by 2040, established when the EU had no 2040 target foreseen.

The energy and green transition are the process towards climate neutrality. Turning climate and environmental challenges into opportunities will make the transition just and inclusive for all.

The energy or green transition is thus a road map on how progressively the greenhouse gas emissions can be reduced and the economy transformed with the view to reducing the environmental, energy and climate footprint of any human activity. It also encompasses the promotion of RES against hydrocarbons, the production of alternative fuels, the electromobility, and the development of green energy in general, including hydrogen, as well as storage capacity. This process combined with zero pollution and the protection of biodiversity is enshrined in the Green Deal and in its implementing rules: the Fit for 55 package and REPowerEU. The European Commission helps Member States design and implement reforms that support the green transition and contribute to achieving the goals of the Green Deal. Moreover, the EU is fully committed to being a front runner in implementing the 2030 Agenda for Sustainable Development, jointly with its Member States. The 17 sustainable development goals (SDGs) aim at protecting the planet from climate change and environmental degradation and at improving quality of life, so that it can support the needs of present and future generations, the very notion of sustainable development. As of 2020 the European Commission has reinforced its analysis and monitoring of the achievement of SDGs in the European Semester process. In parallel Member States are mainstreaming SDGs in their policy making and developing targeted policies to move towards sustainable development.

The green transition is broader than the energy one as the former is holistic in terms of transformation of the economy and management of human activities, while the latter refers to the transition of the energy sector. Decarbonising the energy system is critical to reach the EU's climate objectives in 2030, 2040 and 2050. At the same time energy needs to be secure

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

and affordable for consumers and businesses. To that effect, Member States must transform their energy systems into a fully integrated, digitalised and competitive component of an EU energy market that is based largely on RES. In addition to regulatory reforms, Member States need to enable and promote further investments in clean energy, including energy efficiency. In that respect the promotion of green hydrogen, as the fuel of the future, is key for the energy transition and is eligible for financial support by the European Hydrogen Bank, a financing instrument to accelerate the establishment of a full hydrogen value chain in Europe, by creating investment security and business opportunities for European and global renewable hydrogen production. Trans-European Networks of Energy (TEN-E) supported financially by the Connecting Europe Facility (CEF) are instrumental in promoting the green transition and developing through Projects of Common Interest (PCIs) and/or Projects of Mutual Interest (PMIs) the appropriate new cross-border energy infrastructure in Europe or rehabilitating and upgrading the existing one.

### **III. The interaction between circular economy, green transition, and carbon neutrality.**

The still prevailing linear economy model is the one that leads to the still prevailing unsustainable production and consumption patterns, to the overuse of the planet's resources exceeding its carrying capacity, to environmental degradation, loss of biodiversity and to the climate crisis. It is only thanks to circular economy, the new economic model, that all the above challenges can be successfully addressed. Indeed, circular economy will preserve the already scarce resources of the planet, ensure resource efficiency, reintroduce in the economy the so much needed for the energy transition and digital economy critical raw materials, and most importantly reduce the climate, environmental and energy footprint of any human activity, while creating green jobs. As regards the latter, the International Labor Organization estimates that transitioning to a circular economy could increase global employment by 7-8 million jobs by 2030.

The key main pillars of EU action are green growth, blue economy, and digital economy. The overarching umbrella is circular economy which needs to be mainstream to all these three pillars to make them circular and promote interaction amongst them: ensuring thus circular digital green growth and circular blue, green growth economy. This mainstreaming needs to be both vertical - top down and bottom up - and horizontal. Vertical from the EU level, to the Member State level, covering the central, regional and municipal level, and horizontal in mainstreaming circular economy into all EU and national policies with the view to making them circular: circular agriculture, fisheries and aquaculture, circular tourism, transport, energy, etc. Circular economy has also to be mainstreamed in the business sector as circular entrepreneurship, and in the Environmental and Social Governance, ESG to upgrade it into CESG, i.e. circular environmental and social governance. Indeed, moving to a circular model can benefit businesses. By redesigning business models, production processes and products, circular businesses can significantly reduce their material, energy, and waste management costs, resulting in higher yields and competitive advantages, and benefit from green financing for their projects.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Promoting circular economy within the three aforementioned pillars of EU action and mainstreaming it vertically and horizontally ensures also compliance with the EU Taxonomy Regulation which promotes green projects and ensures green financing. The implementation of all the above requires circular economy strategies and plans, at national, regional and local level. As regards the last one, it is important from now on to promote the holistic concept of circular city, instead of the narrower smart city one. It also requires circular economy plans at company level through Circular ESG, to promote circular entrepreneurship. New EU reporting requirements are foreseen to that effect, together with the interdiction of green washing.

The circular economy contributes to climate neutrality by fundamentally changing *inter alia* the production process, the use of resources and the way we dispose of resources. About 45% of global greenhouse gas emissions come from product manufacturing and use, along with food production. Applying circular economy strategies in just five key areas - cement, aluminum, steel, plastics, and food - could eliminate almost half of global greenhouse gas emissions from the production of goods - 9,3 billion tonnes of CO<sub>2</sub> by 2050. This is equivalent to cutting current emissions from all transport to zero (Circular economy Overview 2024, EIB).

In concrete terms the contribution of circular economy is deployed in the following terms:

- a) Reduction of the greenhouse gas emissions by keeping products and materials in use longer - through reuse, repair, remanufacturing, and recycling the circular economy cuts emissions associated with raw material extraction, production, and waste management.
- b) Minimization of waste. Landfills and mass burning incineration release significant CO<sub>2</sub> and methane. Circular strategies reduce waste generation, thus reducing emissions from waste treatment.
- c) Lowers demand for virgin resources. Extracting and producing new materials (like steel, aluminum, or plastic) is energy intensive. Using recycled materials or designing for longevity cuts this demand, saving energy and reducing emissions.
- d) Encourages renewable energy and sustainable design. Circular models often align with clean energy use and eco-design principles, which further support climate neutrality goals.
- e) Promotes carbon capture through biological cycles. In the bio-based part of the circular economy (e.g., composting, regenerative agriculture), carbon is absorbed and stored in soils and biomass, acting as a natural carbon sink.

In short, the circular economy supports climate neutrality by decoupling economic growth from resource consumption and emissions, helping to build a low-carbon, resilient, and sustainable future.

To boost green transition, eco-innovation, AI, robotics, RES investments and energy storage are instrumental. They require mostly for their production critical raw materials for which the EU is in need: they are scarce and the rare earths in the EU are seldom. Critical raw materials are also key for aerospace and defense.

It is thanks to the circular economy and the recycling pillar of waste management that such critical raw materials can be identified, recovered, and reintroduced in the economy. To

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

that effect, Regulation (EU) 2024/1252 of 11 April 2024 establishing a framework for ensuring a secure and sustainable supply of critical raw materials was adopted (OJ L, 2024/1252, 3.5.2024).

### IV. Conclusions

Notwithstanding the declaratory emblematic importance that circular economy has gained in the EU thanks to the Green Deal and its implementing legal framework, as well as worldwide thanks to the references to it in the last COPs under the UNFCCC, and in the SDGs, the rate of circularity worldwide is declining. In the last five years up to 2023, humanity consumed 500 billion tonnes of materials, nearly equal to what was consumed during the entire 20th century. The global circularity rate has fallen steadily from 9.1 in 2018, when Circle Economy Foundation began measuring, to 7.2% in 2023. More virgin materials are consumed than ever, while the share of secondary materials is in decline. This results in exhausting more and more the carrying capacity of the planet and making the threat that two planets will be needed by 2050 seem unfortunately realistic.

At the EU level, the aim is to double recycled material use, in terms of its share of the economy's total material use, between 2020 and 2030, as set in the 2020 Circular Economy Action Plan. Increasing the use of secondary materials would reduce the extraction of primary raw materials and related environmental and carbon impacts. Recycled material accounted for 11.8 % of material used in 2023, an increase of 1.1% from 2010, a rate which is considered low, indicating the economy is still mostly linear. This slight positive trend is mainly due to increases in waste recycling rates driven by Member States to meet EU recycling targets. Nevertheless, the EU is not currently on track to double the circular material use rate by 2030 and more generally to transform progressively its economy into a circular one.

The circular transition process goes hand in hand with the energy and green transition ones and requires all the adopted pieces of legislation under the policy framework of the Green Deal to be fully implemented at EU level and within the Member States. The circular economy transition process is both a top down and a bottom up and has a strong social component represented by the social circular economy, as regards the latter. Energy communities promoting RES and social cooperative initiatives are key to fully involve in the process the civil society in a circular entrepreneurship mode and to enable it to gain ownership in the implementation of circular economy. Moreover, the phasing of fossil fuels, in particular of coal is supported by the Just Transition Fund in the territories expected to be the most negatively impacted by the transition towards climate neutrality.

The exacerbation of the climate crisis and the limited mainstreaming of the circularity in the economy requires additional efforts for a vertical and horizontal mainstreaming at all policy levels and in all the sectors of the economy through tailored circular economy plans and CESG as regards circular entrepreneurship. The new narrative requires the holistic model of circular economy to become the rule and to prevail, not only at EU but also at global level. Key drivers to that effect can become the citizens of the planet shaping the new concept of circular citizen and of circular household leading to a reduction of the environmental, carbon and energy footprint of any human activity. The environment has no borders and in this

## PROCEEDINGS

---

combat against climate change only a universal response can provide the solution through circular economy.

#### **Abstract**

Circular economy (CE) initiatives are considered as key strategies to contributing to energy and ecological transition and to achieving sustainability development goals. Although the importance policy makers give to these measures little is known about what drives and hinder them, so further research is needed to help to provide the optimal conditions maximizing the drivers and minimizing the barriers. Here we aim to identify the drivers and barriers of the implementation of CE measures at EU regional level. To do so we will use the Flash Eurobarometer Survey 498 on “Small and Medium Enterprises, Resources Efficiency and Green Markets, wave 5”, a dataset that allow us to understand how an extensive sample of European regions undertake circular strategies to be more sustainable with reliable, complete, and homogenous data. This survey was undertaken by the European Commission between November and December 2021 and contains information gathered from interviews with 14,158 managers of SMEs from the 27 Member States of the EU and includes a series of questions that allow the exploration of SMEs' activities in relation to the circular economy and the drivers and barriers they face. One of the main strengths of this survey is that the micro-data file contains the codes of the regions where enterprise headquarters are located. This paper will contribute by better understanding what is behind each one of these drivers and barriers, which will facilitate the design of policy tools to boost circularity measures carried out by EU firms and will then facilitate sustainable transition to achieve EU targets of climate neutrality by 2050.

# THE NEW TRADITIONAL URBAN PLANNING AND ARCHITECTURE AS A GUIDE TO SUSTAINABILITY

**Panetsos A. Georgios**

*Professor, University of Patras, Department of Architecture*

[georgiospanetsos@hotmail.com](mailto:georgiospanetsos@hotmail.com), [panetsos@upatras.gr](mailto:panetsos@upatras.gr)

## Abstract

Since the Renaissance, learned architects, as producers of urban and architectural forms, have argued for the validity of their design choices based on the mythical or historical past, invoking the classical theory of imitation or the various versions of historical architecture recorded in theoretical treatises or documented by impressions.

Originality and inventiveness, qualities related to the historical category of artistic avant-garde, became values of architecture and elements of distinction of the architect only with the advent of Modernism, at the beginning of the 20th century.

A little earlier, local traditional architectures, architectures without theoretical substance or interest in innovation, based on the building practice and the decorative, had begun to emerge as one of the potential sources of a new scholarly architecture with ethical and, sometimes, political arguments.

The tug-of-war between (scholarly) Modernism and any (scholarly neo-)Traditional Architecture resulted in the reduction of the latter to a style, which undertook to invest otherwise Modernist structures. The final fusion of the two, especially under the influence of the demand for heritage conservation, produced completely meaningless hybrids, which only respond to the demands of the hasty consumption of images.

In the context of globalization, a New Traditional Urbanism and Architecture emerges not as an obsession with a particular local style, but as an international design approach. Based on the logic of continuous improvement, which governed Classical architecture, it seeks to combine individual intelligence with handed down knowledge. Above all, it is a cultural choice that seeks to incorporate elements largely foreign to the “authentic” tradition: sincere tolerance for the differentiation of stylistic approaches and transcendental views of architecture, knowledge and thought, sound reason and vision, precise performance, economy and sustainability, political responsibility, public duty and symbolic representation, which create communities and identities, cultural plurality and diversity, and of course the responsible, moral and ethical exercise of the corresponding professional practices.

**Keywords:** Literary architecture, traditional architecture, classical tradition, imitation, sustainability

### URBAN AND PERI-URBAN FORESTS, THEIR CONTRIBUTION TO SUSTAINABLE DEVELOPMENT

**Radoglou Kalliopi**

*Professor, Department of Forestry and Management of Environment and Natural Resources, University of Thrace*

[kradoglo@fmenr.duth.gr](mailto:kradoglo@fmenr.duth.gr)

#### Abstract

Urban Forests and trees outside forests are vital for sustainable development. Forests play a significant role in achieving the United Nations' Sustainable Development Goals (SDGs). They function as extensive carbon sinks, absorbing greenhouse gases and contributing to SDG 13 (Climate Action), and they provide a wealth of biodiversity, aligning with SDG 15 (Life on Land). Forests are indispensable in fostering clean air and water, thus contributing to SDG 6 (Clean Water and Sanitation), SDG 3 (Good Health and Well-being), and SDG 11 (Sustainable Cities and Communities). Peri-urban forests play a multifunctional role and provide various important ecosystem services. Forest management can influence forest structures through silvicultural treatments (forest system, rotation age, and thinning regime) and affect environmental services provision.

This work aims to present the ecosystem services provided by peri-urban forests in Greece, and an analysis of two peri-urban forests will be discussed in the presentation. These forests consist mainly of Conifers species, mainly *Pinus brutia*, and they are vulnerable to disturbances (forest fires), pests and diseases, and environmental stress conditions. They require specific forest management. The peri-urban forest protects the city from floods, regulates the runoff and absorption of rainwater and extreme phenomena, prevents erosion, and protects the soil. It improves environmental conditions in the city, reduces extreme air temperatures, retains a large amount of dust, and protects from noise. The peri-urban forest improves climate change's effects by storing carbon in five pools (above ground, underground biomass, dead wood, forest floor, and soil carbon). Above all, peri-urban forests have a high recreational and amenity value, as they provide recreation to residents of the city, which is highly appreciated due to the lack of open space in the cities and insufficient space for tree growth.

**Key words:** forest ecosystems, forest management, conifers species, environmental services.

### CITY OVERTOURISM VERSUS ECONOMIC, SOCIAL AND ENVIRONMENTAL SUSTAINABILITY

**Angelidis Minas**

*Professor Emeritus, National Technical University of Athens, School of Architecture,  
Department of Urban and Regional Planning  
[angelimi763@gmail.com](mailto:angelimi763@gmail.com)*

#### **Abstract**

Tourism has undoubtedly contributed significantly to the economic development and cultural prominence of many cities over the last century. In recent decades, world tourism has grown at an accelerating rate, which has had considerable impacts on the economy, the society and the environment of the expanding tourist areas of cities.

The increase in tourist flows (more pronounced during the last two years, that followed the covid period), created pressures that exceed any “capacity limits” of the reception areas. This has been explained in terms of city «overtourism» - characteristically intense in Venice but also intense mainly in cultural heritage zones of several cities of Southern Europe, including Athens.

More severe tensions due to **overtourism** -expressed through the impressive rise of the Airbnb sector- concern housing; in particular, increase in **rents for natives**. Other important tensions include infrastructure (transportation, parking, health facilities) and changes in land use - at the expense of green spaces and areas with traditional building ensembles.

All this requires a new approach for tourism – culture and cities, aligned with the respective UN SDGs – which are gaining wider and wider recognition.

It is more necessary to integrate the strategic priorities for tourism - culture and cities into the overall strategic planning of cities, which should include objectives and measures to address the housing problem, protect and promote cultural heritage and regulate other critical sectors.

The presentation will discuss in more depth both general proposals for the sustainable spatial planning of tourist zones of cities as well as more specific proposals for the tourist zones of Athens in particular.

**Key words:** Overtourism, sustainable development, cities, Athens, European Union

## **DEMOCRATIC THEORY, URBAN PLANNING IDEOLOGY AND PUBLIC PARTICIPATION IN THE ERA OF ARTIFICIAL INTELLIGENCE**

**Lalenis Konstantinos**

*Professor, Department of Planning & Regional Development, University of Thessaly, Greece*  
[klalenis@uth.gr](mailto:klalenis@uth.gr)

### **Abstract**

The subject focuses on the intersection of democratic governance, urban development, and advanced technology. Democratic theory deals with the principles and practices that enable effective and equitable governance by the people. Historical philosophical insights reveal that figures like Rousseau advocated for direct democracy and expressing the general will, while John Stuart Mill emphasized liberty, representative democracy, and the empowered, informed citizenry necessary for active public dialogue and engagement. Herodotus and Thucydides highlight the foundational role of public discourse in early democratic societies.

Urban planning ideology, informed by these democratic perspectives, emphasizes both technocratic expertise and participatory approaches. Many theorists argue that planning is inherently political and inseparable from issues of politics and ethics. Recognizing this, contemporary planners generally agree that "value-neutral" planning is impractical and inappropriate as an ideal.

Public participation in urban planning is crucial for aligning urban development with democratic ideals. It focuses on inclusive decision-making processes that reflect the diverse needs of communities, empowering citizens to express their preferences through advanced participatory technologies.

AI offers transformative potential in urban planning by optimizing resource distribution, improving traffic flow, and supporting sustainability. However, urban planning ideology must carefully consider the ethical implications to ensure these technologies promote equity and sustainability rather than exacerbate existing inequalities. While AI can enhance democratic processes by facilitating participatory decision-making through the analysis of extensive citizen input, it also poses risks concerning data privacy, algorithmic bias, and transparency, which could undermine democratic values.

Integrating AI in urban planning must be guided by a democratic ethos, ensuring that technological solutions align with public interests and respect democratic principles like participation, representation, and accountability. Maintaining transparency in AI algorithms and processes is crucial for building trust and adhering to democratic ideals, avoiding potential issues of power imbalance or disenfranchisement.

By understanding these foundational democratic theories, we are better equipped to guide the implementation of AI in urban planning, ensuring that it serves the public good and supports robust, participatory governance.

**Key words:** Democratic theory, public participation, planning ideology, participatory planning, artificial intelligence, means of participation

## **CULTURAL HERITAGE AND SUSTAINABILITY: AN INTIMATE RELATIONSHIP**

**Konstantinidou Elena**

*Associate Professor, National Technical University of Athens, School of Architecture*  
[ekonstantinidou@arch.ntua.gr](mailto:ekonstantinidou@arch.ntua.gr)

### **Abstract**

Cultural heritage and sustainable development are increasingly seen as interconnected concepts that support one another in significant ways. The heritage of the “past” and the sustainability of the “future” are undeniably linked, coexisting and depending on each other. Cultural heritage is regarded as a crucial resource for socio-economic progress and sustainable development, contributing significantly to the creation of smarter, greener, and more socially aware and inclusive societies.

Preserving and promoting cultural heritage is essential for safeguarding the identities, traditions, and histories of communities. It also plays a crucial role in advancing sustainable development across economic, social, and environmental dimensions. Culture is a vital factor in development, and preserving heritage is key to achieving sustainability.

This presentation focuses on several key questions regarding the future and potential uses of the Cultural Reserve in the context of sustainable development. Some of these questions include: Have we fully understood the potential of cultural heritage in promoting sustainability? In what areas and contexts can we explore the connection between cultural heritage and sustainability? How can cultural heritage serve as a driving force for sustainable development? What is the relationship between sustainability and the intrinsic and functional values of heritage? What conflicts, contradictions, pressures, challenges, threats, and issues affect the sustainability, resilience, and longevity of our heritage? What practices can ensure effective and efficient heritage management? What principles, best practices, approaches, methodologies, and tools can be used to integrate cultural heritage into sustainable development? Additionally, what is the current situation in Greece?

The preservation and promotion of cultural heritage, alongside sustainable development policies, is becoming increasingly important. As we face major global challenges such as climate change, energy transitions, armed conflicts, and social inequalities, the need for effective management and integrated protection of architectural cultural heritage has never been more vital.

**Key words:** Cultural heritage, Sustainable development, cultural reserve, sustainability

## **CLIMATE NEUTRAL CITIES AND CITIZENS’ WELFARE**

**Kottaridi Constantina**

*Professor, Department of Economics, University of Piraeus, Director MSc and Laboratory in Bioeconomy, Circular Economy and Sustainable Development*  
[kottarid@unipi.gr](mailto:kottarid@unipi.gr)

### **Abstract**

Six Greek cities have signed climate contracts with the European Commission (EC) driving them to climate neutrality by 2030 through a holistic approach and massive action plans. Climate contracts with the EC are strategic agreements that align national and local climate goals with EU-wide initiatives to combat climate change. These contracts provide a structured framework for funding, collaboration, and implementation of climate policies, ultimately contributing to sustainable development and improving citizens' welfare.

Research on climate-neutral cities underpins their potential to significantly improve citizen welfare through environmental, economic, and social benefits. These benefits entail, Improved Air Quality and Health, economic growth and job creation, social inclusion and community resilience and enhanced urban livability. Cities awarded with the EU Mission Label benefit from financial and technical support, enabling them to implement impactful climate actions while serving as models for others. Furthermore, mechanisms adopted provide guidance and support in transforming cities to modern, smart, climate neutral communities. Such mechanisms include access to resources and funding, policy alignment and coherence with EU objectives, stakeholder engagement.

Athens, Thessaloniki, Kalamata, Ioannina, Kozani, and Trikala are the six Greek cities that have been awarded with the Climate Neutral Label of the EC. These cities, among the 100 European ones, have committed themselves to implement structural plans aiming at a different city model. Climate contracts with the EC are not just environmental tools; by integrating climate action into welfare-enhancing strategies, these contracts offer a pathway to a sustainable and prosperous future for all citizens.

Baretta and Bracchi (2023a; 2023b) examine the European Mission to create at least 100 climate-neutral cities by 2030. They emphasize the role of cities as innovation hubs, using Climate City Contracts (CCCs) to actively engage citizens and stakeholders.

This approach fosters public trust and delivers health, environmental, and economic benefits while reducing urban vulnerability to climate risks. In their second article, they explore the social dimensions of climate-neutral strategies, highlighting their potential to address equity and improve the quality of life for marginalized communities.

Ricciardi and Callegari (2023) focus on innovative urban planning tools, such as digital twins, to model and enhance the resilience and welfare outcomes of climate-neutral cities. Hirvilammi et al. (2021) argue that addressing climate neutrality requires rethinking traditional welfare models to integrate ecosystem health and social wellbeing. The paper highlights how urban initiatives for biodiversity preservation and sustainable living can directly improve mental health, physical health, and social welfare, particularly in the face of global environmental challenges.

### ENABLING ACCESSIBILITY, DISABLING DISABLEISM

**Rodi P. Alcestis**

*Professor of Urban Design and Planning*

*Department of Architecture, University of Patras*

[aprodi@upatras.gr](mailto:aprodi@upatras.gr)

#### **Abstract**

From Leonardo da Vinci’s Vitruvian Man to Le Corbusier’s Modular Man and the standardized figures in architectural handbooks, design has historically been shaped by norms of able-bodiedness. These ideals, rooted in the image of the white, non-disabled male, have long influenced architectural thought, shaping both education and professional practice.

In recent decades, concepts such as Universal Design and All-Inclusive Design have dominated discourse, promoting accessibility for all. However, emerging research in access studies reveals new challenges due to evolving disability and inclusion frameworks, intersectional perspectives, and diverse bodily experiences. While accessibility codes provide a legal baseline, their implementation often stops at minimal compliance—such as the mere addition of ramps—without considering the emotional and experiential impact of spaces. As a result, disabled individuals frequently encounter built environments that fail to support their dignity, autonomy, and full participation in public and private life.

This presentation seeks to move beyond regulatory compliance by exploring critical spatial dimensions of disability and inclusion that can inspire designers to develop accessibility-focused solutions that are creative rather than restrictive. Drawing from historical perspectives and contemporary accessibility thinking, we examine the role of designers in shaping inclusive environments and their impact on users.

Our research investigates the Greek built environment where systemic planning failures have contributed to widespread barriers to dignity and mobility. At scales ranging from apartments and buildings to city blocks and neighbourhoods, we analyse key urban factors that promote inclusive design: adaptability, aesthetics, autonomy, efficiency, equitability, flexibility, perception, privacy, safety, and social interaction.

By integrating culturally specific evidence with innovative urban paradigms, our findings provide a transformative approach to accessibility with far-reaching implications for researchers, practitioners, and policymakers. This research not only expands the discourse on inclusive design but also offers actionable strategies to shape more equitable, dignified, and user-centred environments.

**Key words:** Universal Design, disability studies, accessibility, inclusive environments, design for all, Greek built environment.

### **BUILDING NEW PLACES OF CREATIVE ECONOMIES;RENEWAL AND RE-USE OF ABANDONED BUILDINGS AS COWORKING BUILDINGS IN ATHENS’ CENTRAL DISTRICTS**

**Gospodini Aspa**

*Professor of Urban Planning and Design, Dept. of Planning and Regional Development,  
University of Thessaly, Volos, Greece*

[gospod@uth.gr](mailto:gospod@uth.gr)

#### **Abstract**

In the past decade, *‘coworking spaces’* (CWS) have emerged as a new and promising urban phenomenon promoting new entrepreneurship, creativity and innovation, and especially related to young professional practitioners. The emergence of CWS is strongly associated to real market conditions in many large European cities. More specifically, high rent prices of office spaces act as constraints for young entrepreneurs and professional practitioners of the creative middle classes to make a start and develop their business. Moreover, existing real estate laws as well as landlords usually require tenants to sign multi-year leases, often a 3 to 5-year minimum commitment. Given the unpredictable future of new businesses, entrepreneurs and young professionals are reasonably reluctant to make such long-term commitments, opting to start in a home-office. However, home-office is often not a proper professional installation due to location away from the city centre or inner-city zone. This creates certain difficulties for young entrepreneurs and professionals to meet their clients and also bad feelings of a kind of isolation. Handling the above situation, abandoned old industrial edifices and warehouses, and yet old vacant office buildings in declined urban areas, were renovated and transformed into Coworking spaces (CWS) in many large European cities. CWS are regarded as accelerators of flourishing urban economies, designed to host creative people and entrepreneurs who endeavor to break isolation of home-office, and to find a proper modern environment that favors meetings and collaboration. The rise of CWS and its implications and impacts are largely unstudied yet.

This presentation focuses on Athens’ inner-city areas and their potentials of creating CWS. Following almost a decade of public depth economic crisis in Greece (2010-18), a large number of commercial spaces, office spaces, residences, as well as whole buildings have been abandoned and remain unused in declined inner-city areas in Athens. The present paper provides maps of existing vacant spaces and buildings; it analyses and classifies them into specific categories and spatial clusters. It finally draws from experience in other European cities to propose guidelines to local authorities, policy makers, and building owners, for their reuse and transformation into CWS, and the creation of specific new epicentres of entrepreneurship, creativity and innovation in Athens’ inner-city areas.

**Keywords:** ‘coworking’ buildings, spatial clusters of new entrepreneurship, creativity and innovation, Athens’ inner-city areas.

# DEMOGRAPHIC TRANSITIONS, LOCAL ECONOMIES AND METROPOLITAN SYSTEMS IN-BETWEEN SUSTAINABILITY AND RESILIENCE

**Salvati Luca**

*Department of Methods and Models for Economics, Territory and Finance, Faculty of Economics, Sapienza University of Rome, Via del Castro Laurenziano 9, I-00161 Rome, Italy*  
[luca.salvati@uniroma1.it](mailto:luca.salvati@uniroma1.it)

## Abstract

By integrating different exploratory and interpretative approaches, this study identifies various explanatory models of the life cycle of a metropolitan system, based on progressive phases that respond to differentiated and complex regional and local contexts, with specific reference to the European continent. The empirical results indicate the most current trends in the old continent, which has basically reached the end of a long socio-economic cycle, and is about to enter a new urban regime. To better prefigure this new regime, an interpretative framework has been proposed that analyses the development paths and simultaneously analyses the temporal, spatial and sectoral dimensions. The progressive demographic decline and the structural change of many regional economic systems suggest a slow transition towards models potentially less sustainable from an environmental point of view, and with a particularly heterogeneous level of resilience to future exogenous shocks. Also thanks to the impact of the economic crisis and the pandemic, the new urban regime will presumably be very different from those observed throughout the last century. Its integrated analysis requires continuous improvements in official statistics indicators and in interpretative approaches based on exploratory and inferential techniques. In recent years, regional and local socioeconomic systems have increasingly been interpreted as complex, articulated and internally fragmented organisms, difficult to manage and plan. The intrinsic difficulty in the quantitative analysis of how these systems are articulated and consolidated, growing or progressively declining, highlights the need for original interpretative visions, which can link regional economic theory and statistical analysis with the most current themes of demographic, historical and geographical disciplines. The seminar therefore proposes a study path, and a presentation of the research tools used, which integrate different methodologies and empirical approaches. Also by exploiting the rich heritage of digitalized data gradually available on a large scale from unofficial sources, the quantitative analyses presented here allow us to outline evolutionary models of local systems and urban growth, so as to capture differentiated socioeconomic dynamics that have shaped metropolitan regions in Europe over the last century. Based on the use of a large collection of multidisciplinary indicators, the statistical analysis has also allowed the identification and profiling of integrated development dynamics at different scales of observation, which can be traced back to specific historical phases, social contexts and economic cycles, thus contributing to the understanding of how urban development can adhere to principles of sustainability and resilience in the long term. The results of the analysis demonstrate how scale and agglomeration factors – which played a very relevant role in the last century – are increasingly less linked to growth processes, also suggesting the growing importance of non-strictly economic forces acting at a local scale.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Larger metropolitan systems seem to escape this general model, adhering to individualistic growth paths that are difficult to predict, even in the short term. Also thanks to the impact of the economic crisis and the pandemic, the new urban regimes in Europe are, already in the most recent decade, very different from those observed throughout the last century. The knowledge acquired stimulates the construction of development models that take greater account of endogenous and exogenous constraints on urban growth, with the aim of planning more sustainable regional economic systems, and allowing metropolitan regions to approach those sustainability and resilience objectives long pursued on paper and more difficult to achieve in practice.

**Keywords:** Economic growth, urbanization, demographic transitions, local economies, metropolitan systems, sustainability, resilience

### **FORESTRY AND FOREST-BASED WOOD PRODUCTS: DISCUSSING THEIR ROLE FOR SUSTAINABILITY AND CLIMATE NEUTRALITY AT LOCAL, REGIONAL AND GLOBAL SCALE**

Organized by:

*University of Thessaly, Department of Forestry, Wood Sciences and Design*  
[gntalos@uth.gr](mailto:gntalos@uth.gr)

#### **Abstract and Topics**

Forests have long played an extremely important role in our economy and society, as they help create jobs and are a source of wood, food, medicines, materials, clean water, and many other goods. For centuries, forests have been a thriving source of cultural heritage and construction, tradition, and innovation, with wood serving as a cornerstone of these activities.

However, as important as forests—and the wood they provide—have been in the past, their role will be even more essential for our future. Forests are a natural ally in adapting to and combating climate change and will play a vital role in making Europe the first climate-neutral continent by 2050. Greenhouse gas emissions and removals from forests, as well as forest products like wood, will play a key role in achieving the ambitious net sink target of -310 million tons of carbon dioxide equivalent for the Union. Forests and their wood-based resources also make an important contribution to our ambitious biodiversity targets, safeguard livelihoods in rural areas and beyond, and support a sustainable forest bio-economy based on the most sustainable forest management practices. This is underpinned by a recognized and internationally accepted dynamic concept of sustainable forest management, which considers multifunctionality, forest diversity, and the three interdependent pillars of sustainability.

Furthermore, given the increasing and sometimes competing demands on forests, we also need to ensure that the amount of wood we use remains within the limits of sustainability and is used optimally, in line with the principle of cascading use and the circular economy approach. This will ensure, as far as possible, the substitution of fossil-based materials with wood and other circular products that have a long lifespan and are of greatest value for carbon storage and the circular economy. Wood, as a renewable material, plays a pivotal role in fostering a future that balances innovation with environmental responsibility.

The special session will focus on the role of forestry and forest-based wood products in sustainable development at local, regional and global level and more specifically at the following key topics:

- Sustainable forest management
- Forestry and sustainability
- Biomass- wood for energy production
- Sustainable development of mountainous areas
- Circular economy in forestry and forest – based products
- Forest bioeconomy and innovation
- Wood technology and forest-based wood products

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- Non wood products
- Forest based wood biomass and renewable energy.
- Sustainable construction with wood.
- Climate change and the role of forestry and forest based products.
- Carbon markets and the role of forests and wood products
- Entrepreneurial ventures in the forest value – chain
- Biodiversity and sustainable development
- Agroforestry
- Urban forestry
- Innovative and IT technologies in management of forest resources

[karagg@uth.gr](mailto:karagg@uth.gr)

## Abstract

This paper explores the ongoing debate surrounding the forest bioeconomy and its potential to transform national economies, with a particular focus on Europe’s strategic policies and financial tools. In light of the recent report on the progress made in implementing the European Bioeconomy Strategy, this study aims to explore how Europe’s renewable organic resources, specifically those derived from forests, can be utilized more sustainably to mitigate the impacts of climate change and address environmental pressures (European Commission, 2011). While significant efforts have been made to monitor and measure forest bioeconomy development across Europe, existing literature reveals a lack of standardized methodologies for assessing its impact across EU member states, making cross-country comparisons challenging. Moreover, there is no consensus on the definition or scope of the forest bioeconomy, further complicating the evaluation of financial support and its effectiveness across different forest bioeconomy sectors, such as sustainable forestry, biomass production, and forest-based industries (Lovrić et al., 2020; Kardung et al., 2020; Rinn et al., 2022).

The objective of this study is to address this gap by evaluating the impact of European funding and expertise on Greece’s forest bioeconomy. Specifically, the study will develop an evaluation model to measure the economic benefits derived from European funding, such as co-financed programs and research projects, and analyze their contribution to regional development and sustainability outcomes in Greece’s forest bioeconomy.

**Keywords:** Forest Bioeconomy, European Programs, Sustainability, Bioeconomy Policies, Greece

## Introduction

The bioeconomy has seen rapid growth in recent years, driven by the need for sustainable resource management and climate change mitigation. It focuses on producing and transforming renewable biological resources into food, animal feed, bio-based products, and bioenergy (Trydeman et al., 2015). Through circular and sustainable models, the bioeconomy

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

can address global challenges like climate change, soil erosion, and increasing demand for food and energy (European Network for European Development, 2019). Additionally, it contributes to economic development and job creation, particularly in rural areas, while promoting environmental sustainability.

The 2018 revision of the European Bioeconomy Strategy emphasizes the importance of financing mechanisms to support bio-based industries. However, research on the role of European funding programs in forest bioeconomy policy implementation remains limited. Studies such as those by Thöle et al. (2021), Albrecht et al. (2021), and Lovrić et al. (2020) have explored regional bioeconomy financing, yet there is a lack of comprehensive analysis on Greece’s forest bioeconomy.

This study aims to assess the impact of European funding on Greece’s forest bioeconomy by developing an evaluation model that measures economic and regional benefits. Given Greece’s historically low bioeconomy development (Haarich, 2017) but strong interest in its expansion (Silaidi, 2018), understanding the role of EU programs is essential for shaping future policy strategies and setting priorities for sustainable development.

## Theoretical Background

### Conceptual Approach to the Bioeconomy

The bioeconomy is a broad concept with multiple definitions depending on the context (Mittra & Zoukas, 2020). Initially coined by Enriquez and Martinez in 1997, it refers to economic activities derived from scientific research on biological mechanisms applied in industry (Martinez, 1998). The European Commission (2012) defines the bioeconomy as the economy based on renewable biological resources and their transformation into food, feed, materials, and energy. This broad definition allows for multiple interpretations and strategic approaches. Bugge et al. (2016) identify three main bioeconomy models:

1. **Biotechnology-driven** – Focuses on research commercialization and technological applications, with a strong emphasis on genetic engineering, synthetic biology, and industrial bioprocesses (Philp, 2017).
2. **Bio-resource-based** – Aims to balance economic expansion with environmental sustainability by optimizing resource use, enhancing agricultural productivity, and promoting the use of underutilized land for biofuel crops (Luana & Blind, 2017).
3. **Bio-ecology-oriented** – Prioritizes biodiversity, circular economy principles, and sustainable resource management by emphasizing ecosystem protection, reducing soil degradation, and maximizing organic waste recycling (Hausknot et al., 2017).

These models influence policy and investment decisions worldwide, as nations develop bioeconomy strategies tailored to their economic, environmental, and technological contexts.

### Bioeconomy as a Policy Project

The bioeconomy has been central to EU policy since the 1993 White Paper, which emphasized investment in biotechnology for economic growth. The concept gained prominence with OECD reports (2001, 2009) and the European Commission’s strategies,

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

including "Bioeconomy for Europe 2020" and the 2012 Bioeconomy Strategy, which integrated sustainability and circular economy principles. The 2018 revision expanded the definition to encompass all sectors using biological resources, highlighting innovation and the role of digitalization in bio-based industries (EC, 2018).

### **Bioeconomy Policies in Europe**

Since 2007, EU policies have actively promoted the bioeconomy as a driver of sustainable development. Germany pioneered national bioeconomy strategies in 2010, followed by Finland in 2014. By 2015, several EU member states had adopted bioeconomy policies, aligning them with green growth and circular economy principles (Global Bioeconomy Policy Report, 2020). The integration of bioeconomy policies with other EU frameworks, such as the Green Deal and Farm to Fork Strategy, underscores the shift toward sustainable resource use and climate resilience.

### **The Bioeconomy in Greece**

Despite its relatively low ranking in bioeconomy development compared to other EU member states (Haarich, 2017), Greece possesses significant potential for bioeconomy expansion (Silaidi, 2018). The sector generates €27 billion in turnover and employs approximately 500,000 workers, with agriculture accounting for 80% of bioeconomy activities (Karagouni, 2017). Although Greece lacks a dedicated national bioeconomy strategy, several policies support biological resource management, including:

1. **Common Agricultural Policy Strategic Plan (2023-2027)** – Promotes sustainable agriculture and bio-based innovations.
2. **National Climate Change Adaptation Strategy** – Encourages the sustainable use of biological resources to mitigate climate change.
3. **National Smart Specialization Strategy (RIS 2021-2027)** – Focuses on regional innovation in bio-based industries.
4. **National Development Strategy (2021)** – Identifies the agro-food sector as a priority for economic growth.

### **Forests and the Bioeconomy**

Forests play a crucial role in the bioeconomy by providing raw materials, supporting biodiversity, and offering ecosystem services. The European Green Deal promotes forest resilience within the circular bioeconomy framework, emphasizing the transition to bio-based products and sustainable forestry practices. Non-timber forest products (e.g., medicinal plants, mushrooms) are valued at €23 billion annually in the EU, yet Greece lacks systematic data collection and policy integration for these resources (Lovrić et al., 2020). Sustainable forest management is critical for maximizing the economic and ecological benefits of forest-based bioeconomy activities.

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### **Biomass and Sustainability Indicators**

Biomass plays a pivotal role in bioeconomy development, as it serves as a renewable energy source and a raw material for bio-based industries (Lewandowski, 2015). Biomass sources include forestry and agricultural residues, organic waste, and algae-based materials. Assessing the sustainability of biomass production requires evaluating key indicators such as resource efficiency, pollution reduction, and socio-economic impacts (Fritsche et al., 2018).

Two primary approaches to sustainability in the bioeconomy include:

- **Weak sustainability** – Maintains a market-driven perspective, allowing economic growth while implementing compensatory environmental measures (Hoffman, 2012).
- **Strong sustainability** – Imposes strict ecological constraints, ensuring that natural resource use does not exceed regenerative capacities (Bennich & Belyazid, 2017).

Understanding these frameworks is essential for evaluating bioeconomy policies and shaping Greece’s transition to a sustainable bioeconomy model. A holistic approach to bioeconomy policy must integrate economic, environmental, and technological factors while ensuring long-term ecological balance.

### **Monitoring and Evaluation of the forest bio-economy**

Tracking bioeconomy transitions and their impacts can be seen as a Herculean task, as they cannot be easily captured using current economic statistics. Organic and non-organic products are rarely distinguished when official data are collected. However, production along bioeconomy supply chains and its impacts on sustainability require measurement and evaluation to enable informed policy making. (Jander, 2020).

For example, the BioMonitor project (2022) attempts to address the information gap in bioeconomy research by reframing the existing data and modeling framework. The study Kutay (2021): A Cross-Country Measurement of the EU Bioeconomy: An Input–Output Approach, within the Biomonitor project, manages to measure the added value of the bioeconomy that is not immediately apparent but rather hidden in other industries in part bioeconomy. The information platform created within the project provides a measure of the share of the bioeconomy for the EU-28 countries for the period 2005–2015 based on input-output tables.

In the study by Lovrić, et al. (2020), an attempt was made to form an overview of the European forest-based bioeconomy research field by mapping the actual research activity in the field, based on projects from the EU Framework Programs and the European Research Area, supplemented with data on self-reported research abilities. Projects included in the CORDIS database were used as the main data source for mapping research activity in the field of forest-based bioeconomy. The analysis is limited to the period 2008–2018, where the projects listed fall under FP7, H2020 and the European Research Area Work Program (ERA-NETs). The study assesses the coherence and synergies of public research and innovation programs and maps research activity across industries and sectors in order to help improve the existing knowledge base, while making two clear policy recommendations: the need for stronger involvement of research organizations from countries of Eastern Europe to the international scientific community in the field of forest-based bioeconomy, emphasizing a geographical coverage criterion in future research and innovation planning and the design of

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

research and innovation calls for projects that thematically cover multiple forest-based bioeconomy supply chain categories.

In the recent study by Rinn, et al. (2022), a comparative analysis of forest bioeconomies and our understanding of them in selected countries is carried out, and the level of comprehensive data on projects supported by the RDP 2014–2020 is assessed. This analysis showed that the perception and definition of the forest bioeconomy varies from country to country. That is why it is not possible to compare the level of financial support of the forest bioeconomy between countries. It is also not possible to use it as a single and comparable indicator to measure sustainability.

The study by Lovric, et al. (2021) provide an insight into the future of the forest-based bioeconomy sector in selected countries in South-Eastern Europe. It elicits forest-based bioeconomy experts' understanding, opinion and level of agreement on the future implementation of the bioeconomy concept by 2030/2050, through two rounds of the Delphi method. The study contributes to a better understanding of regional contexts related to forest-based bioeconomy status and further development, while demonstrating that regional and national priorities in forest-based bioeconomy should be set in regional, national and sub-national strategic documents (Winkel, 2017), to further support the implementation of the concept.

### Research Objective

Over the past twenty years, EU policymakers have prioritized the expansion of organic value chains through various EU policy initiatives and research programs. Despite the growing popularity of the bioeconomy in Europe, its research and statistics lag in several ways, such as the lack of a comprehensive database and statistics for bio-based industries, the lack of a transparent methodology for bio-based data collection, and the lack of comprehensive data and value chain indicators depicting the processing system flows of different biological materials (Kardung et al., 2019).

Despite efforts to monitor the EU's bioeconomy and individual national bioeconomies, there is still no common approach to monitoring and measuring the bioeconomy across EU states, making cross-country comparisons difficult. Furthermore, according to Kardung (2020), there is a pressing need for methodological improvements in monitoring and measuring bioeconomy-based production models.

In particular, Greece currently lacks a targeted National Strategy for the bioeconomy, despite the high priority assigned by the Greek government to resource efficiency, energy efficiency, and low-carbon investments (Papadopoulou, 2018). While the importance of the bioeconomy is widely recognized globally for its economic, social, environmental, and touristic dimensions, in Greece, the bioeconomy model has not yet received the attention it deserves.

From a review of the relevant literature, the following key gaps have been identified:

- **Lack of a comprehensive database:** Despite increasing policy interest, the absence of structured, evidence-based monitoring systems for bioeconomy sectors hinders effective policymaking and adaptation (Ronzon, 2021).
- **Absence of a transparent methodology for data collection:** While agriculture and forestry sectors are always included in bioeconomy monitoring, other sectors, such as the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

chemical industry, are only partially accounted for in most international monitoring frameworks, resulting in inconsistencies in data collection and interpretation (Jander, 2020).

Additionally, as the concept of bioeconomy evolves, it becomes increasingly necessary to integrate various interdisciplinary approaches that combine economic, environmental, and technological perspectives. A successful bioeconomy model relies not only on the sustainable use of biological resources but also on innovative processing techniques, digitalization, and market-oriented solutions. The role of digital tools, artificial intelligence, and blockchain technology in monitoring and improving supply chain traceability is becoming more prominent, highlighting the need for more advanced methods in data collection and analysis.

Furthermore, policy fragmentation remains a key challenge. While several EU member states have developed targeted bioeconomy strategies, Greece still lacks a coherent national policy framework dedicated to bioeconomy implementation. This creates inconsistencies in the allocation of resources, regulatory frameworks, and investment strategies. A critical aspect of this research will be to assess the effectiveness of existing policy instruments in supporting the forest bioeconomy in Greece, identifying both best practices and bottlenecks that hinder progress.

The primary objective of this research is to create a comprehensive database consolidating all funding sources that have supported forest bioeconomy initiatives in Greece—whether in research, business support, or project development. The goal is to evaluate the impact of these funding mechanisms and the expertise they provide on the forest bioeconomy sector in Greece through the development of an evaluation model. This model will assess the economic benefits derived from these support mechanisms and their contribution to regional development.

Through this research, a better understanding of the bioeconomy's role in achieving sustainability goals will be established, ensuring that Greece can harness its rich natural resources effectively while balancing ecological conservation with economic growth. The study will also explore how Greece can align its national bioeconomy strategies with broader EU objectives to attract more funding, stimulate innovation, and enhance the competitiveness of its forest-based industries in the global market.

This study aims to examine the role of European programs in the implementation of bioeconomy policies in the forestry sector in Greece. It seeks to identify the main challenges and constraints that hinder the effective application of these policies in Greek forests. Furthermore, it explores how bioeconomy policies can be better integrated into forest management practices to enhance sustainability and economic growth. A key focus is assessing the impact of European programs on local economies and environmental sustainability through the promotion of forest bioeconomy initiatives. Additionally, the study aims to develop proposals and best practices that can optimize the use of European resources in advancing Greece's forest bioeconomy.

This research provides a unique contribution by focusing on the application of bioeconomy policies in the forestry sector, an area of significant importance that remains underexplored in Greece. While the bioeconomy has gained traction across Europe, limited research has been conducted on how these policies are effectively implemented in Greek

## PROCEEDINGS

---

forests and the extent to which they contribute to sustainable resource management and regional development.

A key aspect of this dissertation is its in-depth analysis of European funding mechanisms, including Horizon Europe, the LIFE Programme, the European Agricultural Fund for Rural Development (EAFRD), Interreg Europe, and the Bio-Based Industries Joint Undertaking (BBI JU). By assessing the role of these programs, the study aims to identify both the opportunities and barriers associated with financing the forest bioeconomy in Greece. Furthermore, it examines how EU-funded initiatives align with national and regional priorities, ensuring that bioeconomy strategies are effectively integrated into forestry management and economic planning.

To provide a comprehensive assessment, the research employs an innovative mixed-method approach that combines qualitative and quantitative methodologies. This includes stakeholder interviews, case study analysis, policy evaluation, and statistical modeling to measure the economic, environmental, and social impacts of bioeconomy policies. By incorporating diverse analytical techniques, the study ensures a holistic understanding of how EU programs influence the forest bioeconomy and their potential to drive sustainable development.

Beyond policy evaluation, this dissertation seeks to develop actionable recommendations that address Greece’s specific challenges in implementing bioeconomy initiatives. The findings will support the design of tailored policy proposals that enhance the effectiveness of bioeconomy programs, promote investment in forest-based industries, and encourage the adoption of sustainable practices. These recommendations will be grounded in empirical evidence, making them valuable for policymakers, industry stakeholders, and researchers seeking to strengthen Greece’s bioeconomy framework.

Ultimately, this research aims to contribute significantly to both scientific knowledge and policy discourse on the forest bioeconomy in Greece. By shedding light on the role of European funding in fostering sustainable forest management, it provides insights that can inform future bioeconomy strategies at the national and EU levels. The study underscores the importance of aligning economic growth with environmental sustainability, ensuring that Greece can fully capitalize on its natural resources while meeting long-term ecological and economic objectives.

### **Methodology approach**

The research employs a mixed-method approach, incorporating both quantitative and qualitative methodologies to ensure a comprehensive analysis of the impact of European programs on Greece’s forest bioeconomy. The methodology is structured into two main components: data collection and data analysis.

### **Data Collection**

To obtain robust and diverse insights, a quantitative survey will be conducted using a structured questionnaire. The survey will target key stakeholders from the quadruple helix model, ensuring representation from multiple sectors that influence and are influenced by the bioeconomy. The target groups include:

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

1. **Research Community:** This category includes universities, research institutions, and innovation hubs specializing in bioeconomy, forestry, and sustainability. Their input will provide valuable information on technological advancements, research gaps, and knowledge transfer within the sector.
2. **Businesses & Industry Representatives:** Engaging chambers of commerce, trade associations, and forest-based industries will shed light on the role of private investment in the bioeconomy, the commercialization of bio-based products, and the market dynamics shaping the sector.
3. **Public Sector:** Ministries, local and regional authorities will be surveyed to assess policy implementation, regulatory frameworks, funding mechanisms, and governmental support for bioeconomy-related initiatives.
4. **Civil Society:** Non-governmental organizations (NGOs), forest management organizations, and environmental advocacy groups will provide insights into community engagement, sustainability concerns, and the social impact of bioeconomy policies.

In addition to the survey, semi-structured interviews with key informants from these groups will be conducted to gain deeper qualitative insights. This will help capture expert opinions, challenges faced in the implementation of bioeconomy policies, and potential solutions to enhance effectiveness.

### Data Analysis

The collected data will be processed using advanced statistical and analytical techniques to ensure meaningful interpretations and actionable conclusions. The analysis will involve:

- **Descriptive Statistical Methods:** Measures such as averages, percentages, and variance analysis will be employed to summarize the data and identify key trends in funding allocation, policy implementation, and stakeholder participation.
- **Trend Analysis:** Historical data and survey responses will be analyzed to examine changes in bioeconomy-related indicators over time, such as investment trends, technological advancements, forest area utilization, and sustainability practices.
- **Comparative Analysis:** The study will compare Greece's bioeconomy development with other EU countries, identifying best practices and areas for improvement.
- **Regression and Correlation Analysis:** These methods will be used to assess the relationships between different variables, such as the impact of EU funding on economic growth, employment rates, and sustainability outcomes.
- **Thematic Content Analysis:** Qualitative data from interviews and open-ended survey responses will be systematically categorized and analyzed to identify recurring themes, stakeholder perceptions, and policy recommendations.

By employing this rigorous methodology, the study aims to provide a detailed assessment of the effectiveness of European programs in shaping Greece's forest bioeconomy. The findings will offer valuable insights for policymakers, researchers, and industry stakeholders, facilitating evidence-based decision-making and strategic planning for sustainable bioeconomy growth.

### Conclusion

The transition to a sustainable society is increasingly challenged by complex factors such as climate change, population growth, rapid urbanization, and widening income disparities. Recognizing the need for a balanced approach, the United Nations affirmed in 2018 that sustainable development must integrate economic progress, social inclusion, and environmental protection. Over the past two decades, EU policymakers have acknowledged the bioeconomy as a crucial driver of sustainability, emphasizing its alignment with the Sustainable Development Goals (Wesseler & von Braun, 2017; Zilberman et al., 2018). This recognition has led to the launch of various policy initiatives and research programs at the EU level, including the European Bio-Based Industries Joint Undertaking, which aims to accelerate the transition to a circular bioeconomy (Wesseler & von Braun, 2017). The recent revision of the European Commission’s Bioeconomy Strategy (European Commission, 2018a) further underscores the high priority of bioeconomy policies on the EU’s political agenda.

Despite these efforts, quantifications of the bioeconomy have traditionally focused on economic and social aspects, with less emphasis on environmental considerations (European Commission, 2018b). A holistic approach is required to assess the broader implications of bioeconomy activities, particularly regarding their dependency on forest ecosystems. Evaluating the contribution of forest ecosystems to gross domestic product (GDP) demands an in-depth examination that extends beyond the direct economic impact of the forestry sector. This includes an assessment of the indirect and induced effects of forestry-related activities on other industries and their role in broader economic systems.

A resource-based bioeconomy necessitates a comprehensive understanding of available natural resources, their geographic distribution, and their economic potential. Identifying the synergies and trade-offs between forests and other land uses is essential for ensuring sustainable resource management. As Wolfslehner et al. (2019) highlight, a well-defined framework for resource utilization, property rights, and economic valuation is critical for optimizing bioeconomy strategies.

This research contributes to this broader understanding by applying a robust methodological framework to collect and analyze relevant data on Greece’s forest bioeconomy. Through the identification of key sustainability indicators, this study aims to provide a comprehensive assessment of the forestry sector’s role in the Greek bioeconomy. The findings will offer valuable insights for policymakers, industry stakeholders, and researchers, enabling more informed decisions that support sustainable development, economic resilience, and environmental stewardship. Ultimately, by advancing knowledge in this field, this dissertation seeks to enhance the effectiveness of bioeconomy policies and contribute to the long-term sustainability of Greece’s natural and economic resources.

#### **Abstract**

The construction industry plays a pivotal role in global energy consumption and environmental impact, with traditional building materials and practices contributing significantly to carbon emissions and resource depletion. Sustainable wood-based construction materials present a promising solution to these challenges, offering renewable, low-carbon, and energy-efficient alternatives.

This study explores the potential of wood-based materials in reducing energy input across the lifecycle of construction projects, from production and transportation to use and disposal. Key attributes, including carbon sequestration, thermal efficiency, and adaptability, are highlighted alongside advancements in engineered wood products such as cross-laminated timber (CLT) and glued laminated timber (glulam).

The integration of these materials into modern construction practices not only reduces reliance on energy-intensive materials like concrete and steel but also supports the transition to a circular economy. Challenges such as resource management, certification, and resistance to widespread adoption are also addressed.

The findings underscore that the use of sustainable wood-based materials can significantly lower energy demands, enhance building performance, and contribute to achieving global sustainability goals.

**Key words:** Sustainable construction, wood-based materials, energy efficiency, engineered wood products, cross-laminated timber (CLT), circular economy, green building.

## **Abstract**

Nowadays, climate change has become a very threatening issue, affecting ecological stability and sustainable management of terrestrial ecosystems worldwide. Various task force groups currently seek big data and Artificial Intelligence (AI) related solutions for retaining forest ecosystems equilibrium. Hence, there is an urged need for investing in new big data AI technologies for achieving forest ecosystem stability and resilience against abrupt climate changes. Advanced technological approaches, such as the dMRV (digital Measurement Reporting Verification) framework, integrated with AI big data management and prediction methods, may be a promising mitigation solution against radical climate change ecosystem challenges. DMRV framework is a package of established technologies such as IoT, and satellite imagery, for environmental data monitoring, enriched with AI and Blockchain for data integrity and transparency.

This paper surveys latest advances in AI-based technologies, as well as case studies in smart forest management and sustainable development. As the migration of Forestry 4.0 to Forestry 5.0 paradigm encourages Human-AI interactions, this work aims at inspiring both forest officials and scientists to invest in AI technology solutions for efficient forest management against climate change challenges.

**Key words:** Forest ecosystems, AI technologies, dMRV, tree pruning biomass, Climate Smart Forestry (CSF), Sustainable Forest Management (SFM)

---

### Introduction

Nowadays, climate change has become a very threatening issue, affecting ecological stability and sustainable management of terrestrial ecosystems worldwide. Forest ecosystems are straightforward related with their large volume carbon sequestration capacities, however, they seem to gradually degrade through uncontrolled deforestation, and unexpected wildfires. According to Food and Agriculture Organization of the United Nations (FAO), the last three decades, the area of primary forest worldwide has been decreased by over 80 million hectares through deforestation, forest degradation, and wildfire (<https://www.fao.org/state-of-forests/en/>).

Moreover, in many countries, current practices for forest and agricultural tree pruning residues, still encourage their elimination by open burning in the field, thus increasing the risk of fire spreading, while simultaneously leading to uncontrolled emission of greenhouse gases (GHG). It has been estimated that the open burning of olive branches in the field emits 1600 kg CO<sub>2</sub>/ton, 90 kg CO/ton, suspended particles 17 kg/ton, with a simultaneous loss of organic matter of 7.44 kg/ton (Kostenidou et al 2013). In Greece, residual biomass burned per each crop type lies within 4, up to 8 tn/ha per year (2021 reference year), according to national inventory report (NIR) for GHG (NIR of Greece for GHG and other Gases for the years 1990-2021, Ministry of Environment and Energy). In a circular bio-economy context, the utilization of residual tree pruning biomass is a key axis of the European Green Deal, which aims to reduce GHG emissions by 55% by 2030 compared to 1990 levels ([https://commission.europa.eu/strategy-and-policy/priorities-2019-2024/european-green-deal\\_en](https://commission.europa.eu/strategy-and-policy/priorities-2019-2024/european-green-deal_en)).

At the same time, regarding the 17 UN Sustainable Development Goals (SDG) in forest domain, various task force groups are seeking for big data, Artificial Intelligence (AI) related solutions for bringing back forest ecosystems equilibrium. On the other hand, Climate Smart Forestry (CSF) is an emerging paradigm in sustainable forest management (SFM), in order to tackle with the threatening challenges of climate change. CSF requires AI based, novelty and proactive forest management methods to efficiently equip modern decision making systems, that will in turn, provide forest ecosystem resilience.

Hence, there is an urged need for investing in new big data AI technologies to achieve forest ecosystem stability and resilience against abrupt climate changes. Advanced technological approaches, such as the dMRV (digital Measurement Reporting Verification) framework, integrated with AI big data management and prediction methods, may be a promising mitigation solution against radical climate change ecosystem challenges. DMRV framework is a package of established and well tested technologies, such as IoT (internet of things), and satellite imagery, for environmental data monitoring, enriched with AI methods and Blockchain structures, for data integrity and transparency.

This paper is a comprehensive review of cutting edge technologies, along with applied case studies and projects in forest domain, as a proof of indication for improvement in SMF and sustainable development. As the migration of Forestry 4.0 to Forestry 5.0 paradigm encourages human-AI interactions, we hopefully believe that this study may inspire both forest officials and scientists, to invest in AI integrated technology solutions for efficient forest management against climate change challenges.

### Climate smart forestry integrated solutions for SFM

As mentioned, CSF term is directly related to the SFM and it is also associated to intelligent AI based solutions that attempt to mitigate carbon emissions, and therefore to tackle climate challenges (Nabuurs et al. 2017). Those solutions should be data driven and integrated with state of the art technologies (AI, Machine Learning, satellite imagery, IoT sensors, blockchain, etc) in order to efficiently provide flexible and resilient models against radical climate changes, that strongly affect forest ecosystems. The real challenge lies in the fact that there is still limited knowledge on the way that climate changes affect and interact with forest ecosystems. That precious knowledge should be gained, enriched, and managed properly via combined remote monitoring and intelligent AI methods and algorithms, in order to provide proactive and predictive solutions for SFM, and to build smart forest decision support systems (Keenan et al. 2019).

**Table I: Smart Forest sensor types**

| Sensor Type                   | Application                                                         | Advantages                                                                                                                                                                                       | Disadvantage                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| GNSS and Wifi, etc.           | Localization                                                        | Accurate position determination                                                                                                                                                                  | Problems in covered terrain due to signal inconsistency                                                                            |
| Temperature sensors           | Temperature monitoring                                              | Provide insight into temperature fluctuations and can be linked to multiple other inputs (e.g., moisture), available to measure temperature in different media                                   | Without linkage to other data, has a very narrow application in forestry. Continuous monitoring requires a good network            |
| Moisture and humidity sensors | Measuring water content in air or soil                              | Produces climate data and can be easily linked to inputs like temperature. Applications can range from humidity measurements under the canopy to determining the trafficability of forest roads. | Real-time monitoring is only possible with a good network. Setup can be complicated.                                               |
| Soil pH                       | Determining the solubility of different nutrients in soil           | Understanding the nutrient uptake capability in relation to the soil.                                                                                                                            | On-site measurements with embedded sensors cannot reach the accuracy as an in-lab measurement                                      |
| RGB camera                    | Generates images of the surroundings                                | Wildlife monitoring, understanding forest road condition, and navigational aid                                                                                                                   | Processing of pure image data can be challenging. Large amounts of data are generated when high-quality video/photo is used        |
| Thermal imaging camera        | Measures heat profiles of the surroundings                          | Understanding of thermal gradients; useful in phenotyping; forest fire detection SAR                                                                                                             | Large amount of data generation possible, and image processing can be challenging.                                                 |
| LIDAR sensor                  | Provides detailed topographical data                                | Assists in biomass estimation, forest structure analysis, and navigation                                                                                                                         | Most commonly used technologies today are expensive. Problem with rain or other contamination on the transparent window.           |
| Multispectral cameras         | Measuring multiple spectra at the same time for simple data linking | Simple setup to obtain a broad range of data that is directly linked to one another                                                                                                              | The collection of multiple wavelengths at the same time can lead to poor performance of each detector compared to specialized ones |

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

To put it simple, at first, we need to provide an automated means of measuring monitoring and collecting those dynamically evolving forest ecosystem information data, so as to build the necessary knowledge database. Normally, such data will emanate from the combined use of multiple IoT sensor cluster network implanted in designed areas within forest ecosystems (see Table I), and Proximity Detection Technologies (see Table II), at close range (lidar, cameras, UAVs etc), or remote satellite imagery (Ehrlich-Sommer et al. 2024). In this way, all raw data related with the current forest status, or timely deforestation changes, and the effects climate change eventually, has had on land, could be tracked and enrich that knowledge database. Apart from forest monitoring, those technologies could perfectly fit as a solution, to other application types, such as the monitoring and control of life cycle chain of forest or agricultural biomass, from its early origin to its finite customer consumption products. Moreover, those combined sensor and imagery technologies could enable the creation of three-dimensional (3D) forest models (Torresan et al. 2021).

**Table II: Proximity Detection Technologies**

| Device                    | Application                                                                                                                               | Advantages                                                                                                                 | Disadvantage                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Satellites                | Remotely detect various data inputs (Temperature, moisture, images, etc.)                                                                 | Ease of access to data, standardized datasets, and ability to monitor almost the entire surface of the earth               | In many cases dependent on weather conditions. Continuous monitoring of a certain area is hardly possible. Large distance to the area of interest. |
| Drones                    | Remotely detecting various data inputs.                                                                                                   | Cheap and easy to operate by a human; operation below the tree canopy is possible                                          | Limited operation time for non-fixed wing variants; challenging to autonomize for flight below the canopy                                          |
| Unmanned ground vehicles  | Autonomous data collection and interaction with ground-based equipment. The potential communication link with other equipment like drones | Longer operation time compared to drones, with a high payload and is simple to use                                         | Without external computing sources, fully autonomous maneuvering is still not possible                                                             |
| Existing forest machinery | Data collection                                                                                                                           | Simple sensors that do not require a lot of human interaction can gather data without interfering with the human workflow. | Complex sensors pose issues due to harsh operating conditions, e.g., LIDAR on a harvester. Therefore, they are limited to simpler sensors          |

Those massive raw and heterogeneous data could be exploited and processed by predictive AI models to predict e.g. the size, spread, or probability of a fire outbreak in a certain area, or the spatial progression of a currently running fire, or carbon footprint estimations of forest management activities, etc. One step beyond, when AI is combined with 3D forest modelling, and virtual reality (VR), it could provide future predictions of forest states, via a virtual forest model (see Figure 1), which is actually, its forest digital twin (Luo et al. 2023).

Figure 1: Forest Digital Tween

The perspectives of an SFM integrated solution paves a way for smart forest digital transformation establishment (Ehrlich-Sommer et al. 2024). Digital transformation is about involvement of advanced technologies for SFM, via necessitating AI integrated technology solutions as mentioned above, which are all included in dMRV paradigm framework, as we will discuss in the next paragraph.

### DMRV integrated solution framework for SFM

As known, dMRV stands for digital measurement (or monitoring), reporting and verification, and it is considered as the updated “digital” version of the well tested, and established plain MRV paradigm. As its initials entail, it is a set of key technologies applied for multi stage process control activities, and particularly for real-time monitoring, data integration, and automated verification processes. It consists of four major technology pillars : 1. IoT, 2. AI, 3. Proximity Detection Technologies, and 4. Blockchain, where each one serves its own specific purpose, and altogether complement an end to end solution.

Particularly, IoT sensors and their associated network built in the surveillance field (e.g. a forest ecosystem), are used for monitoring environmental parameters (CO<sub>2</sub> levels, smoke levels, temperature, humidity), or carbon emissions with real-time data streams (see Table I). Then, the raw and heterogeneous data they produce from various sensor source types need to be processed and managed properly via AI algorithm dataset analysis (heterogeneous pattern identification, classification, anomaly and outlier detection). One step beyond, AI and its machine learning (ML) product models could provide predictions on various related areas, such as the probability of a fire outbreak in a certain area, or current running fires spatial progression, or carbon removal process predictions, thus improving accuracy and proactive management of carbon reduction processes.

The third pillar, the remote imaging technologies (satellite imagery), along with the close range ones (lidar, cameras, UAVs etc), where both form the proximity detection technologies (see Table II), provide high-resolution images for monitoring environmental

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

changes, and thus for tracking and verifying carbon sequestration processes. The dMRV advantages of using combined remote and close range imagery are multiple, including the reduced surveillance duration, the better field work organization, the lower costs, the improved work quality, and the elimination of various risk factors during manual inspection procedures. Moreover, dMRV synergy with AI's, Neural Network (NN) algorithms allow for faster detection and classification of aerial, satellite, and sensor monitoring data.

Finally, the blockchain completes the end to end integrated dMRV solution, acting as a decentralized ledger for recording and verifying data, maintaining unalterable records of all transactions and data entries by all ledger stakeholders, thus enhancing transparency and trust among participants during data transactions. CSF urges for dMRV integrated solutions, as it requires efficient forest management methods to support forest decision systems and thus, to address the challenges of climate change, including carbon markets and regulatory compliance of EUDR, as well.

### DMRV Solutions for Carbon markets

Carbon markets could be benefited in multiple ways from the integrated dMRV solutions. Particularly, dMRV and especially its blockchain component, ensure that carbon credits are based on real, measurable, and verifiable reductions, regarding GHG emissions. In this way, dMRV improves organization sustainability reports, thus contributing to global carbon emission reductions. dMRV could be considered as a robust framework for tracking and verifying emissions reductions and other environmental impacts, and therefore, it is a significant advancement in the compliance of the voluntary carbon market (VCM) framework.

**Figure 2: DRMV and carbon markets**

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Normally, in a typical carbon market all involved entities should be approved via an appropriate validation and verification body, which is actually a mediator (see Figure 2). Particularly, in the one end, the project developer (or else named supplier) supports carbon removal activity project, by providing all necessary assessment and documentation, which is actually a methodology complied with a standard framework (standard guidelines and methodology documents). On the other end, there is the buyer that purchases the verified credits, in order to compensate against its GHG exhausts and achieve zero neutrality. In between the two, many more entities could be involved (e.g. brokers, investors etc), but the critical intermediate entity is a third-party entity, a Validation and Verification body (VV), that provides project data integrity and transparency, standard regulatory compliance and credit custody management by requesting retirements of credits, at the end of carbon credit transaction chain. Nowadays, that VV body adopts dMRV framework, via an integrated platform, in order to deal with its validation and verification tasks in between the involved entities. Without dMRV, the integrity of the carbon credit market would be compromised, and could eventually lead to a lack of trust and decrease participation from carbon credit chain entity participants.

Many important global carbon market projects fully equipped with cutting edge technologies provide all the necessary means for a complete and robust support of carbon market transaction chain, such is the Open Forest Protocol (<https://www.openforestprotocol.org/>). OFP is an open platform, and particularly a digital, blockchain-based dMRV system, that measures, reports and verifies forest projects data worldwide. Along with Neutral, which is an automated carbon accounting, analysis, reporting platform for tokenized carbon credits and contracts, they both provide an end to end dMRV solution.

### **SFM and EUDR**

It is commonly known that EUDR is a new rule framework that mostly inspects any kind of illegal deforestation activities within EU region. SFM provides a well defined, compact pathway via EUDR, for businesses and governments, and adopts best practices that would protect forest ecosystems. In doing so, the critical issue here is traceability, which necessitates accurate monitoring of any kind of forest activity throughout all the supply chain (e.g forest biomass life cycle chain, from source material origin to its finite processed ready-for-consumption product). Normally, those monitoring data are raw and heterogeneous, as they are emanated from multiple different types of monitoring sources (satellite imagery, lidar, cameras, UAVs, IoT sensors etc), and they have to be processed in order to be accurate and ready for finite decision making systems. Moreover, those data have to be verified and aligned with the existing regulatory frameworks.

Therefore, end to end integrated monitoring and verification platforms are unavoidably urged, such as the dMRV type, that may be well used for inspecting illegal activity and ensuring regulatory compliance of related sector businesses and organizations (agriculture, forestry, and supply chain sectors), which should be aligned to EUDR framework. In this way, dMRV supports SFM to gain control of its goals regarding managing forests and providing the appropriate equilibrium between resource management, protection and sustainability, on a long term basis.

### AI solutions for SFM

AI and its algorithms as a part of an integrated end to end dMRV solution, or even as stand alone approaches, could definitely help to big data forest management processing, prediction modelling, and virtual 3D forest representations, as already have been mentioned above. Nowadays, there are multiple AI software tools for dealing with various forest management tasks, such as, forest simulation optimization systems, forest carbon estimation analysis and accounting systems, carbon prediction systems, geospatial forest inventory data management platforms, intelligent forestry supply chain (procurement and transportation) platforms, to name but a few. In parallel, various sustainable forest management research projects have been carried out successfully, with the adoption of integrated modern technologies, such as the Qingyuan Forest CERN project, with its homonym platform, a holographic forest intelligent data acquisition system for monitoring and displaying 3D forest structure and carbon sink (Wang et al. 2025).

Yet, the most challenging bet to win, is the “human in the loop” promising trend, which is actually a synergistic approach to continuously allow humans to control AI, and at the same time, to align AI with human values, ethics, and legal requirements, to ensure privacy, security, and safety (Holzigner et al. 2022). The human in the loop approach is defined as a set of simultaneous interactions of both computational and human agents, aimed to optimize learning behavior. It actually encourages human activity with its interactive participation with AI agents, in every single process stage, from the very beginning up to the finite end of an automated process. Hence, it indeed, puts the “human in the loop” to enable what neither a human, nor a computer could do on their own.

Forester in the loop, is a similar, remarkable approach inspired by the generic “human in the loop” concept (Holzigner et al. 2022). This approach includes various steps and pathways that encourage the ever evolving continuous human-AI interactions, throughout all forest activity process stages. Particularly, such critical human-AI interactions begin the forest monitoring process, with the forest owners interaction with heads-up displays in their helmets, or VR glasses, in order for them, to gain individual tree information. Conversely, the AI will learn from the forestry worker’s experience during the monitoring process. Moreover, humans interact with a direct navigation system of a driving forest machine, via autonomous control of attached sensors. On the other hand, the expertise of the operators provides input to ML modules, so as together, to co operate, in a value-optimized manner. At the same time, machine manufacturers could be in close interaction with operators and driving forest machines, as well.

### Conclusions

Forest ecosystem stability and resilience against abrupt climate changes, urgently requests for investing in new big data, AI based integrated technologies, such as the end to end dMRV framework. Such combined solutions may be promising for achieving forest ecosystem stability and resilience, against abrupt climate changes. Apart from sustainable forest management, those end to end solutions could be adopted efficiently for EUDR regulatory compliance, or carbon market robust control purposes.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The human in the loop approach, is a new concept applied successfully in those integrated solutions. Unlike the Industry 4.0 paradigm, this approach aims to integrate and increase human participation in the loop process, rather than to replace them, thereby ensuring continuous, secure, and trustworthy human-AI interactions. The migration of Forestry 4.0 to Forestry 5.0 paradigm encourages human-AI interactions, and particularly with its promising human in the loop approach, that will inspire both forest officials and scientists, to invest in AI technology solutions for efficient forest management against climate change challenges, bridging the human-centered AI gap, and the Forestry 4.0 to 5.0 gap, as well.

[evcharitos@uth.gr](mailto:evcharitos@uth.gr)

### **Abstract**

Cryptocurrencies and blockchain technology have recently emerged as innovative tools in carbon markets. The decentralised and transparent nature of the blockchain makes it suitable for monitoring and verifying carbon credits, ensuring that credits are not double counted or fraudulently claimed. By creating a secure and transparent carbon transaction ledger, blockchain technology can enhance the credibility of carbon markets and increase investor confidence.

On the other hand, the environmental debate surrounding Bitcoin mining has largely focused on energy consumption and carbon emissions. Bitcoin's Proof of Work (PoW) algorithm is designed to be energy-intensive, requiring miners to solve cryptographic puzzles to validate transactions. This computing power, in turn, consumes large amounts of electricity, making Bitcoin mining subject to criticism in the context of global climate change.

The growing involvement of cryptocurrencies and blockchain technology presents new avenues of growth in carbon markets. By facilitating direct investments in forest conservation through contracted credits, these technologies enhance both the transparency and accessibility of carbon credit transactions. Nevertheless, it is vital to consider the environmental impacts of blockchain mining and cryptocurrency mining, as high-energy blockchain platforms may inadvertently counteract the environmental benefits of carbon credits. A transition to more sustainable blockchain protocols, such as proof-of-stake, will be necessary to ensure that the integration of digital technology aligns with the climate goals of carbon markets.

In conclusion, forest-based carbon credits, when integrated with blockchain technology, emerging innovations and fair governance, have the potential to contribute significantly to achieving global climate goals. As carbon markets continue to evolve, the combination of technology and natural conservation promises an escalating path to a carbon-neutral future, with forests at the core of climate resilience and environmental stewardship. By investing in forest conservation and expanding carbon credit markets, governments, companies and individuals can play a vital role in the global transition to a low-carbon economy, ensuring the protection of key natural resources for future generations.

## Abstract

This study examines the potential supply of agricultural and forest residues for bioenergy production in Greece, focusing on both the quantity and availability of these feedstocks. Utilizing official statistical data, field surveys, the research identifies the primary residue types from crop production, orchard pruning, and forest management. Emphasis is placed on evaluating the logistical aspects of collection and transportation, as well as the environmental impacts of residue extraction. Preliminary findings indicate that Greece possesses a substantial volume of underutilized residues that could serve as a significant source of renewable energy, thereby contributing to national targets for greenhouse gas reduction and energy security. However, challenges remain regarding seasonal variability, collection costs, and the need for modern infrastructure to efficiently convert residues into bioenergy. The study highlights the importance of policy support, integrated resource management, and stakeholder collaboration to optimize residue utilization. These efforts could enhance rural development, create new employment opportunities, and strengthen Greece's transition toward a more sustainable and resilient energy system.

**Key words:** Forest, bioenergy production, agricultural residues

#### **Abstract**

This study aims into the fascinating connections amongst the road network length, road density, altitude zones, and land use across Greece's unique and varied regions. By examining these relationships, we can uncover how geography shapes the way areas develop and interact within this diverse landscape.

Using freely available online data, GIS software is used to analyze and better understand the road network's role in shaping Greece's landscape. The analysis focuses on the road network and its density calculating the road network length, the percentage and the ratio of roads (km) per area (km<sup>2</sup>) for the thirteen regions of Greece. To explore altitude zoning, the road network is divided into distinct elevation ranges, providing a clearer picture of how roads function at different altitudes. For land use, areas are classified into categories, namely urban, agricultural, and forest, relying on the latest Corine Land Cover data to ensure accuracy and relevance.

Areas with low altitudes tend to have denser road networks and urban development, while inland mountainous regions have sparse roads and are primarily rural or forested. Integrated planning considers altitude, land use, and environmental preservation to ensure roads serve development without degrading ecosystems. Understanding this relationship is critical for developing sustainable infrastructure that balances economic growth, environmental conservation, and social equity.

**Key words:** Regions of Greece, road network, road density, land use, altitude zones, GIS

### Introduction

The road network in Greece has played a crucial role in the country's economic, social, and cultural development. Over the years, the expansion and modernization of Greece's road infrastructure have significantly improved connectivity, trade, and tourism, which are essential for national growth. The structure of transportation networks over time depicts the social ability to overcome at a certain time the spatial constraints, in order the societies to communicate (Tsiotas & Polyzos, 2018). The research by Petrakos and Economou (2014) reveals that southeastern Europe is characterized by a growing regional imbalance, the increasing strengthening of metropolitan regions and by serious discontinuities at their borders, which, in most cases, are a product of isolated border areas. Urban systems with serious deficiencies in medium-sized cities are also a characteristic of southeastern Europe. In most European countries, a great part of the national and the regional network is quite old (Papageorgiou et al., 2012). Road construction is intertwined with the development of organized societies and state structures. It presupposes the formation of collective aspirations and the allocation of resources for the development of a transport system that satisfies the military, commercial, cultural and other purposes (Papageorgiou et al., 2019).

The geography of Greek transport infrastructure is shaped by the influence of historical, economic, political and geomorphological factors and often reflects and/or contributes to the development potential and organization of the spatial network (Mavraki et al., 2020). Transportation and land use are two different aspects of a landscape, but their relationship, despite not being clearly visible, is quite strong (Jedlička et al., 2019). Greece is a country which presents several geographical peculiarities, with many islands, but also several mountainous areas in mainland Greece. The different extent and geographical characteristics of the various Greek regions as well as their different economic activities are reflected in different mobility patterns and road behaviors among the inhabitants of these regions, but also in a different degree of development of the road network (Folla et al., 2023).

While Greece has made significant progress, challenges remain, such as maintaining older roads, addressing traffic congestion in urban centers, and promoting sustainable infrastructure. Future investments in smart roads and environmentally friendly transportation will further enhance national development. Overall, Greece's road network has been a cornerstone of the country's progress, enabling economic growth, improving quality of life, and strengthening regional and international connections.

### Material and methods

A Geographical Information System (GIS) is an organized collection of computer hardware, software, data and personnel designed to efficiently capture, store, update, manipulate, analyze and display all forms of geographically referenced information (Dale & Laughlin, 1987). A major strength of a GIS is that it can accept and merge diverse data into a single database, giving the user a flexible and powerful set of data which to work (Drosos et al., 2016). The process of gathering, managing, analyzing, and visualizing spatial or geographic data to understand patterns, relationships, and trends is the geospatial analysis. We also compute the Pearson's correlation coefficient (PCC) for the road network. PCC is a statistical

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

measure that quantifies the strength and direction of the linear relationship between two continuous variables (Rodgers & Nicewander, 1988).

The road network data obtained and analyzed with the use of open data which are available on the basis of the OpenStreetMap (OSM). The project OSM is a collaborative GIS project with a crowd-sourced approach (Kaur et al., 2017). It is also known as the wikification of GIS, that encourages the volunteers throughout the world to contribute spatial data (Graser & Straub, 2017). In this study was calculated the kilometers and the road network percentage of the thirteen Greek Regions and also the ratio of roads in km per area in km<sup>2</sup>.

For altitude zones the data from Digital Elevation Model over Europe from the GMES RDA project (EU-DEM) was used. The EU-DEM is a Digital Surface Model (DSM) representing the first surface as illuminated by the sensors. The EU-DEM dataset is a realization of the “Copernicus” the European Union's Earth observation programme, managed by the European Commission, DG Enterprise and Industry. The EU-DEM is a 3D raster dataset with elevations captured at 1 arc second postings (2.78E-4 degrees) or about every 30 meters (Liampas et al., 2018). Four altitude zones created because each one presents distinct characteristics that influence land use, including climate, topography, and accessibility (Kazaklis et al., 2014).

For land use the data form CORINE Land Cover 2018 (CLC) was used. CLC is the oldest and most sought-after database of CLMS. CLC was specified to standardize data collection related to land in Europe to support environmental policy development (CLC, 2018). CLC data contribute to a wide range of studies and applications with European coverage. In this study three of the five main land cover / use groups are considered: 1) Artificial surfaces, 2) Agriculture, 3) Forests and seminatural areas. All the data and the categorization used in this study is presented in Table 1.

## Results

The first geospatial analysis was a road network density heat map which is a visual representation that illustrates the concentration of roads in Greece. For the density calculation was used a square cell of 500 meters and the color gradients indicate the varying levels of

density. Table 2 shows the produced heatmap, the yellow color indicates high road density, the purple color medium road density and the black color are areas without roads.

Table 2: Road network density heat map

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

The heatmap effectively highlights Greece's infrastructure distribution, with dense road networks in urban and economically significant regions, while rugged terrain and natural landscapes limit road expansion in other areas. The accessibility provided by road networks facilitates economic activities and population growth in the high-density areas.

The second geospatial analysis was the distribution of the road network which categorized by CLC classes across altitude zones of Greece. The results are presented in following Table 3. Moreover, a road network density analysis was also performed to identify the concentration of roads in Greece and the results are presented in Table 4.

**Table 3: Percentage of roads distribution in Greece**

| Corine Class                           | Altitude zones |         |          |        | Sum     |
|----------------------------------------|----------------|---------|----------|--------|---------|

| Class 1: Artificial areas              | 13.304%        | 2.262%  | 0.343%   | 0.005% | 15.914% |
| Class 2: Agricultural areas            | 40.061%        | 13.418% | 1.880%   | -      | 55.359% |
| Class 3: Forest and semi-natural areas | 8.596%         | 11.760% | 8.241%   | 0.130% | 28.727% |
| Greece's total                         | 61.961%        | 27.440% | 10.465%  | 0.134% | 100%    |

The above table highlights a clear pattern of human activity that is concentrated in lower altitudes, with natural areas more prevalent at higher elevations. The overall Greece's land distribution is mostly (61.961%) in the 0-300 m zone, while higher altitudes account for smaller proportions.

Specifically:

- Artificial areas: Highest percentage is in the 0-300 m zone (13.304%), gradually decreasing as altitude increases. Total: 15.914%.
- Agricultural areas: Dominant in the 0-300 m zone (40.061%) but decline significantly with altitude. Total: 55.359%.
- Forest and semi-natural areas: More evenly distributed, peaking in the 300-800 m zone (11.760%). Total: 28.727%.

**Table 4: Road network density in Greece**

| Corine Class                           | Altitude zones |         |          |       | Overall |
|----------------------------------------|----------------|---------|----------|-------|---------|
|                                        | 0-300          | 300-800 | 800-1800 | >1800 |         |
| Class 1: Artificial areas              | 16.53          | 12.04   | 11.24    | 8.61  | 15.54   |
| Class 2: Agricultural areas            | 4.69           | 4.08    | 4.06     | 0.00  | 4.50    |
| Class 3: Forest and semi-natural areas | 1.94           | 1.62    | 1.41     | 0.49  | 1.61    |
| Greece's total                         | 4.50           | 2.55    | 1.65     | 0.50  | 3.21    |

The data reveals patterns in road density across land cover types and altitude zones, providing insights into the relationship between human activity, topography, and road network development. In the following Table 5 the results are analyzed by category.

**Table 5: Road network density patterns in Greece**

| Findings by Land Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Findings by Altitude Zones                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><u>Class 1: Artificial Areas (Overall: 15.54 km/km<sup>2</sup>)</u></b></p> <p>Highest road density among all classes, reflecting intensive urban and industrial development.<br/>Road density decreases with altitude:<br/>0–300 m: 16.53 km/km<sup>2</sup> (highest density in urbanized flatlands).<br/>&gt;1800 m: 8.61 km/km<sup>2</sup> (lowest, as urbanization is minimal in high-altitude areas).<br/>Key Insight: Urban and industrial areas, concentrated at lower altitudes, demand extensive road networks for connectivity and infrastructure.</p> <p><b><u>Class 2: Agricultural Areas (Overall: 4.50 km/km<sup>2</sup>)</u></b></p> <p>Moderate road density, second to artificial areas, as agriculture requires roads for transportation and access.<br/>Minimal variation across altitude zones:<br/>0–300 m: 4.69 km/km<sup>2</sup> (slightly higher due to larger agricultural zones in flat areas).<br/>800–1800 m: 4.06 km/km<sup>2</sup> (stable density, as agriculture persists in hilly/mountainous areas).<br/>&gt;1800 m: 0.00 km/km<sup>2</sup> (no agriculture in high altitudes).<br/>Key Insight: Agricultural areas maintain consistent road density across altitudes, except in high altitudes where farming is infeasible.</p> <p><b><u>Class 3: Forest and Semi-Natural Areas (Overall: 1.61 km/km<sup>2</sup>)</u></b></p> <p>Lowest road density among all classes, reflecting limited human activity and development in these areas.<br/>Significant decline with altitude:<br/>0–300 m: 1.94 km/km<sup>2</sup> (roads provide access for forestry and tourism).<br/>&gt;1800 m: 0.49 km/km<sup>2</sup> (minimal road presence in remote, high-altitude forests).<br/>Key Insight: Forests and semi-natural areas are less accessible, with road density decreasing sharply as terrain becomes more challenging.</p> | <p><b><u>0–300 m (Overall: 4.50 km/km<sup>2</sup>)</u></b></p> <p>Highest road density, driven by:<br/>High density in artificial areas (16.53 km/km<sup>2</sup>) and agricultural areas (4.69 km/km<sup>2</sup>).<br/>Low-density forests (1.94 km/km<sup>2</sup>) contribute less but still align with human activity in lowlands.<br/>Key Insight: Flat, low-altitude areas dominate Greece's road network, reflecting urbanization and farming needs.</p> <p><b><u>300–800 m (Overall: 2.55 km/km<sup>2</sup>)</u></b></p> <p>Moderate road density, with:<br/>Roads supporting agriculture (4.08 km/km<sup>2</sup>) and semi-natural areas (1.62 km/km<sup>2</sup>).<br/>Key Insight: Transition zones (hilly areas) have less dense road networks than flatlands but still support mixed land uses.</p> <p><b><u>800–1800 m (Overall: 1.65 km/km<sup>2</sup>)</u></b></p> <p>Low road density, as:<br/>Roads primarily serve forests (1.41 km/km<sup>2</sup>) and agriculture (4.06 km/km<sup>2</sup> in limited areas).<br/>Key Insight: Higher altitudes see reduced road density, reflecting less intensive human use.</p> <p><b><u>&gt; 1800 m (Overall: 0.50 km/km<sup>2</sup>)</u></b></p> <p>Minimal road density, with:<br/>Sparse roads in forests (0.49 km/km<sup>2</sup>) and virtually none in agriculture.<br/>Key Insight: Very high altitudes are the least accessible, with roads limited to isolated or strategic purposes.</p> |

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The overall observations for road network density in Greece are:

- **Urban Dominance:** Artificial areas have the highest road density, emphasizing the concentration of infrastructure in urban regions, particularly at low altitudes.
- **Consistency in Agriculture:** Agricultural areas show stable road density across most altitudes (except  $> 1800$  m), supporting the essential role of road networks in rural areas.
- **Forests and Altitude:** Forests and semi-natural areas have the lowest overall road density, with a sharp decline at higher altitudes.
- **Altitude as a Limiting Factor:** Road density decreases consistently with altitude, reflecting the challenges of infrastructure development in mountainous terrains.
- **Greece’s Overall Road Density ( $3.21 \text{ km/km}^2$ ):** Reflects a mix of high-density urban areas and low-density rural and natural areas, balancing accessibility and conservation.

Pearson’s correlation is a measure of the linear relationship between two variables. It quantifies how strongly and in what direction the variables are related. If the data have positive correlation close to 1 it means that the one variable increases and the other also increases. If the data have negative correlation close to -1 it means that the one variable increases and the other decreases, and if the value is close to 0 there is no linear correlation. In the following Tables 6 and 7, the PCC for the road length (km) and land use ( $\text{km}^2$ ), as well as the road length (km) and altitude zones area ( $\text{km}^2$ ), are computed, respectively.

**Table 6: Pearson’s correlation for land use**

| Pearson<br>Correlation Coefficient -<br>Road length (km) & Area ( $\text{km}^2$ ) | Artificial<br>areas | Agricultural<br>areas | Forest and semi-<br>natural areas | Overall |
|-----------------------------------------------------------------------------------|---------------------|-----------------------|-----------------------------------|---------|
|                                                                                   | 0.98                | 0.98                  | 0.95                              | 0.90    |

The Pearson correlation coefficients between land cover type (area) and road length show the strength of association across different land use categories.

- **Urban and Agricultural Dominance:** The highest correlations are observed in artificial areas (0.98) and agricultural areas (0.98), underlining their importance in shaping road networks. These land types require extensive connectivity for economic activities and mobility.
- **Forested Areas Play a Secondary Role:** Although the correlation for forest and semi-natural areas is slightly lower (0.95), it remains very strong, showing the significance of maintaining access to these areas.
- **Overall Correlation Reflects Land Use Balance:** The overall correlation (0.90) confirms that road distribution is closely tied to the proportions of land cover types, with urbanization and agriculture being primary drivers.

**Table 7: Pearson’s correlation for Altitude zones**

| Pearson<br>Correlation Coefficient -<br>Road length (km) & Area ( $\text{km}^2$ ) | Altitude zones |         |          |         | Overall |
|-----------------------------------------------------------------------------------|----------------|---------|----------|---------|---------|
|                                                                                   | 0-300          | 300-800 | 800-1800 | $>1800$ |         |
|                                                                                   | 0.88           | 0.80    | 0.96     | 0.85    | 0.68    |

---

These findings show that road distribution aligns strongly with human needs at lower altitudes while maintaining consistency at higher altitudes for connectivity and access.

- Highest correlation (800 – 1800 m): Suggests that forested and mountainous areas are particularly important in explaining the overall road distribution, possibly due to the connection of isolated regions or key infrastructure like highways cutting through mountainous terrain.
- Strong correlation in low-altitude zones (0 – 300 m): Highlights the dominance of urban and agricultural development in influencing road density.
- Consistent contribution across zones: Despite some variation, all altitude zones show a strong positive relationship, indicating a relatively uniform distribution pattern when viewed holistically.
- Overall alignment with human geography: Correlations reflect the interplay between human activity, topography, and road network development.

The third geospatial analysis was a road network analysis per region for Greece. The Figure 1 shows the comparison of the percentage of road length to the percentage of the area of each region of Greece. The Figure 2 shows the road length for land use class and altitude zones of each region of Greece. The Table 8 present the percentages of the data of Figure 2 in order to identify spatial patterns between the Regions of Greece.

**Figure 1: Comparison of percentages for road length and area of each region of Greece**

Analyzing the above data, it is observed that altitude dictates land use, lower altitudes are heavily dominated by artificial and agricultural areas, while forests and semi-natural areas dominate mid-to-high altitudes. The road distribution aligns with human activity and urbanized and agricultural regions have the most roads, while higher altitudes remain less developed. The Regional differences reflect geography with mountainous regions (e.g., Western Macedonia, Epirus) to have more roads at higher elevations, whereas coastal and island regions (e.g., Attica, South Aegean) focus on low altitudes. The regional pattern identification of roads distribution is presented in Table 9.

**Table 9: Regional pattern identification of roads distribution**

|                                  |                                                                                                                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Land Use (Corine Class) Patterns | Class 1 (Artificial Areas): Dominates in urbanized regions like Attica (54.220% in 0–300 m) and South Aegean (14.409% in 0–300 m). Class 1 presence sharply declines with altitude, as urban areas are concentrated in lower, flatter zones.         |
|                                  | Class 2 (Agricultural Areas): Most significant class overall, dominating road distribution in nearly every region and altitude: Accounts for 40–55% of roads in 0–300 m zones across most regions. Substantial even in mid-altitudes (300–800 m) for |

|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | <p>areas like Crete (25.897%) and Epirus (19.952%). Higher altitudes (&gt;800 m) show minimal agricultural activity, likely due to unsuitability of terrain.</p> <p>Class 3 (Forest and Semi-Natural Areas): Becomes prominent at mid-to-high altitudes, especially in regions like: Western Macedonia (27.373% at 800–1800 m). Epirus (17.372% at 800–1800 m). Peloponnese (9.114% at 800–1800 m). Lower altitudes (0–300 m) see limited road presence for this class, as forests are less common there.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Altitude Zone Patterns | <p><b>Roads Concentrated at Low Altitudes (0–300 m):</b><br/>Across most regions, the majority of roads are concentrated in the 0–300 m altitude zone (e.g., 75–86% of roads in Eastern Macedonia, Attica, North Aegean, etc.). This reflects human activity being centered at lower altitudes, likely due to urban areas, agricultural activity, and flatter terrain.</p> <p><b>Mid-Altitudes (300–800 m) Are Secondary:</b><br/>Regions like Western Macedonia, Epirus, and Crete have substantial road coverage in mid-altitudes (25–45%), often due to hilly agricultural zones or smaller settlements.</p> <p><b>Minimal Road Coverage at Higher Altitudes (&gt;800 m):</b><br/>Regions above 800 m typically have less than 10% of roads, except in areas with mountainous terrain like Western Macedonia (40%), Epirus (20%), and Peloponnese (12%).</p> <p>These patterns suggest that higher altitudes are less developed, with roads mostly serving forested or semi-natural areas.</p> |
| Regional Patterns      | <p><b>Regions With Heavy Low-Altitude Focus:</b> Attica, South Aegean, North Aegean, Central Macedonia: Over 75% of roads are in the 0–300 m zone, often linked to dense population centers or islands with limited high-altitude terrain.</p> <p><b>Regions With Balanced Distribution:</b> Crete, Western Greece, Peloponnese: Significant roads in both 0–300 m and 300–800 m zones, reflecting mixed land use (agriculture, settlements, and semi-natural areas).</p> <p><b>Regions With High-Altitude Dominance:</b> Western Macedonia and Epirus: Stand out for substantial road presence in 300–1800 m zones, with forests and semi-natural areas being a key focus.</p>                                                                                                                                                                                                                                                                                                                   |

The fourth geospatial analysis done in order to focus to the third land use category to the forest and semi-natural areas. The road network length in 3<sup>rd</sup> CLC category is 119,706 km (28.7%) but the area is that the 3<sup>rd</sup> CLC category covers in Greece is 74,207 km<sup>2</sup> (57.21%). The Table 10 presents the percentage of road length and the Table 11 presents road density in forest and semi-natural areas of Greece.

**Table 10: Road length percentage in forest and semi-natural areas of Greece**

| Corine Class            | Altitude zones |         |          |        | Sum     |
|-------------------------|----------------|---------|----------|--------|---------|
|                         | 0-300          | 300-800 | 800-1800 | >1800  |         |
| 311 Broad-leaved forest | 2.329%         | 8.421%  | 6.297%   | 0.022% | 17.070% |
| 312 Coniferous forest   | 3.092%         | 2.789%  | 5.692%   | 0.012% | 11.586% |

Analyzing the road data in forest and semi-natural areas of Greece, it is observed that there is lowland dominance. The roads are concentrated in the 0 – 300 m (29.92%) and 300 – 800 m (40.94%) altitude zones, where most human activities like agriculture, settlements, and semi-natural land use occur. The most roads are in areas with sclerophyllous vegetation, this class accounts for 28.99% of total road length, emphasizing its role in Greece's semi-natural and rural infrastructure. About the forest areas with broad-leaved, coniferous, and mixed forests collectively contribute 38% of road length, highlighting the role of forestry-related infrastructure. Also, there is minimal high-altitude infrastructure in the >1800 m zone there is only 0.45% of road length, indicating limited accessibility in mountainous regions.

Moreover, the altitude impact on the road density is identified. The road density consistently declines with altitude, peaking at 0 – 300 m (1.94 km/km<sup>2</sup>) and reaching its lowest at >1800 m (0.49 km/km<sup>2</sup>). This trend aligns with terrain challenges and reduced human activity at higher elevations. The broad-leaved forest (1.60 km/km<sup>2</sup>) is the most

---

balanced forest class in terms of density across altitude zones and in bare rock ( $0.39 \text{ km/km}^2$ ) there is minimal infrastructure investment, reflecting its remote nature. The dominant road density classes are transitional woodland/shrub ( $1.88 \text{ km/km}^2$ ) and sclerophyllous vegetation ( $1.49 \text{ km/km}^2$ ) which contribute significantly to the road network in natural areas.

The road network in Greece aligns closely with land use and altitude. Sclerophyllous vegetation and forested areas dominate road coverage, highlighting the importance of rural and natural land infrastructure in the country. The road network density in Greece is highest in low-altitude areas (0 – 300 m) and decreases with elevation. The densest networks are found in beaches, transitional woodland/shrub, and burnt areas, reflecting intensive human and economic activity in these regions. Forested areas and semi-natural landscapes exhibit moderate densities, supporting rural and forestry-related activities. Sparse and bare lands, particularly at higher altitudes, have the least road infrastructure.

## Conclusions

The road network distribution in Greece reflects the interplay between human activity, land use, and topographic constraints. The density of roads varies significantly across different land cover types and altitudes, highlighting the country's diverse landscape and socioeconomic patterns.

About the altitude zones and road density, it is observed that the low-altitude areas (0 – 300 m) are the most densely covered, driven by urban centers, agricultural zones, and coastal tourism infrastructure. Road density sharply declines with altitude, with the least-developed road networks found in high-altitude areas ( $> 1800 \text{ m}$ ) due to rugged terrain and limited human settlement.

On the subject of the Land Cover Types and Distribution, it is noticed that artificial Areas with urban and developed zones (e.g., cities, towns) have the highest road density across all altitude zones, reflecting the concentration of economic and social activities in these regions. The agricultural areas have moderate road density that supports agricultural activities, primarily in low- and mid-altitude zones. The forest and semi-natural areas have lower road density but they still maintain networks to support forestry, rural access, and tourism. The most roads in of the 3<sup>rd</sup> CLC category are in transitional woodland/shrub and sclerophyllous vegetation and for this reason these areas used to connect 1<sup>st</sup> and 2<sup>nd</sup> CLC categories.

Also, specific patterns show that Regions like Attica, Crete, and Central Macedonia perform high density road networks, corresponding to high population density and economic activity, and remote regions such as Western Macedonia and Epirus feature lower road densities, especially at higher altitudes, due to challenging terrain and lower population density.

Greece's road network has economic and tourist influences, the coastal and island regions, especially in the Ionian Islands, South Aegean, and Crete, show high road density in proximity to beaches and tourist hubs. The road network in Greece is highly concentrated in low-altitude urban, coastal, and agricultural areas, driven by population distribution and economic activity. In contrast, higher altitudes and sparsely populated areas have sparse road infrastructure, reflecting the natural limitations of the terrain and reduced human impact. This

---

distribution mirrors Greece's dual character as both a center of modern urbanization and a country with vast, rugged landscapes that remain relatively untouched.

The impact of road network altitude zones on land use patterns in Greece is profound. Understanding these dynamics is crucial for informed policy-making and fostering sustainable development.

## Abstract

Landslides of road slopes stand for phenomena resulting in minor to even catastrophic consequences, with impact on road infrastructure and road users. Moreover, properties next to the road may be affected as well. Nowadays, these phenomena occur more and more frequently and their impact becomes more and more higher, due to climate change and forest fires. Thus, adequate preventive measures, are of utmost importance in the context of safety guarantees.

The present paper defines and analyses criteria, such as implementation cost and ease of establishment, implementation range and effectiveness, for appraising measures of landslide prevention, conducting an analytical hierarchy process scheme. A thoughtful set of the appraisal criteria is considered to be a cornerstone for correct and comprehensive evaluation. The preventive measures are selected from most common ones, such as slope change, drainage infrastructures and planting. Results may vary according to special characteristics of each potential landslide field. Evaluation of each criterion may also vary according to the climatic and economic environment in which the appraisal is conducted. In this frame, a measure which is indicated as optimal for a certain study area may be inadequate for another area.

Given the aforementioned, the results show fruitful and interesting findings, attributing scores to the examined measures, in terms of overall and each criterion evaluation. The appraisal methodology presented, may be used as a tool for road operators and competent authorities, so as to assess the most effective preventive measures, with respect to inherent and general characteristics that apply in each case.

**Key words:** Roadside slopes, landslides, appraisal, preventive measures, evaluation

## Introduction

Road slopes are arranged along the entire length of each road infrastructure and their integrity is directly linked to the proper functioning of the road axes, as their deformation or destruction leads to traffic problems, for commercial, professional and tourist purposes. Therefore, it is the duty of road network managers to ensure their maintenance or formation and to take preventive measures for this purpose.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Roadside slope landslides are a phenomenon that may occur due to natural causes, such as heavy rainfall, snowfall, natural disasters (e.g. earthquake) or to anthropogenic causes (e.g. tunnel construction) or felling of trees on the slope (Figure 1).

**Figure 1: Consequences of slope deforestation** (Hill et al., 2024)

The effects of landslides can be very significant, such as the interruption of traffic or even the complete destruction of part of the road network in an area (Figure 2), resulting in the hard movement of vehicles. Secondary consequences include difficulties in traffic, which may be devastating for the economic activity of the area and in other cases, may even pose a risk to the lives of residents, as access to health facilities becomes difficult or impossible, depending on the case and the magnitude of the landslide. Erosion of the slope can even cause dangerous situations for the buildings in the area (Alamanis et al., 2020; Ecoslopes, 2004), since it can lead to erosion and movement of the soil (Figure 1). In our time, landslides are more frequent due to intense or extreme climatic phenomena and forest fires.

**Figure 2: Landslide hazards** (<https://www.climatechangepost.com/news/on-a-global-scale-landslide-hazard-doesnt-seem-to-be-increasing-due-to-climate-change/>)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Landslide prevention measures on road slopes can lead to the avoidance or reduction of these unpleasant effects. For this reason, their implementation before the occurrence of a landslide is of utmost importance.

An important issue that needs to be examined is the effectiveness and cost of implementing these measures. In other words, is it scientifically correct to implement a landslide prevention measure that does not adequately ensure what it was designed for? In addition, the economic aspect of each prevention measure should be examined, as the amount of human and financial resources required is not unlimited and in some cases is quite restrictive.

Taking the above into account, this study presents a methodology for evaluating three of the most common landslide prevention measures, namely terraced slopes (Figure 1), drainage infrastructure (Figure 2) and planting (Figure 3). Thus, the goal is to find the optimal choice, taking into account the specific characteristics and economic environment of each case.

**Figure 3: Terraced slopes** (<https://en.jardineriaon.com/how-to-make-sloping-terraces.html>)

**Figure 4: Drainage infrastructure** (Hearn and Hunt, 2011)

## PROCEEDINGS

---

**Figure 5: Planting** (<https://landscapearchitecturemagazine.org/2018/04/24/slope-style/>)

Considering the above, a tool, meaning a concise methodology for selecting the optimal measure for landslide prevention, is necessary for road operators, so as they can conclude, which is the best preventive method for preventing catastrophic consequences on the road network, without spending excessive or useless resources. This is exactly what the present study deals with, by proposing a simple and comprehensive optimal choice selection methodology for road operators and constructors.

### Methodology

The proposed methodology for the evaluation of alternative measures to prevent landslides on road slopes is that of the Analytical Hierarchy Process (AHP) (Saaty, 2006; Saaty, 2008). This method was chosen in order to take into account the specific characteristics of each case during the evaluation, as relevant studies for engineering tasks have demonstrated (Papageorgiou, 2020; Papageorgiou, 2022; Papageorgiou et al., 2019; Papageorgiou et al., 2020). For example, a road slope that is rocky is very different from another that is clayey, both in terms of the ease of implementing a prevention measure and the cost of implementation. At the same time, each alternative measure requires different amounts of human resources, equipment, materials and project machinery.

To conduct the evaluation using the AHP method, five criteria were used, namely implementation cost, ease of application, versatility, effectiveness and environmental adaptation. Thus, the evaluation scheme is presented in Figure 6.

---

**Figure 6: Evaluation scheme**

In order to carry out the evaluation, a clear description of the evaluation criteria is shown in Table 1. The description was drawn up with the aim of including as fully as possible all the factors that influence the implementation of such a project, as well as its impact to the natural and anthropogenic environment.

**Table 1: Description of evaluation criteria**

| Appraisal criteria              | Description                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Implementation cost</b>      | Cost of application, including machinery, personnel, timeline and required resources, considering location, time and special characteristics of each case |
| <b>Ease of application</b>      | Availability of equipment and materials, range of laying temperatures, familiarity with the technique and possible or current rates of application        |
| <b>Versatility</b>              | Field of its application, the range of geological and slope segments targeted (e.g. high differentiation of slope values, rock, clay, sandy ground)       |
| <b>Effectiveness</b>            | Expected engineering result of the implemented technique, the slope performance after operations                                                          |
| <b>Environmental adaptation</b> | Effects on the environment and degree of adaptation in the natural landscape                                                                              |

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

A clear description of the criteria is important so that the evaluation can be carried out within a specific and clear framework. Furthermore, it includes all the important elements that must be taken into account so that the resulting result is reliable and holistic, i.e. takes into account the specific characteristics and the available budget.

### Results

The three alternative landslide prevention measures examined in this study are evaluated for their adequacy in the criteria that have been established, following a search in the literature and relevant applications (Guzzetti et al., 2015; Pérez-Maqueda, 2019; Capobianco et al., 2025; Maes et al., 2017; Alcántara-Ayala and Sassa, 2023; Schuster and Highland, 2011; Alexiou et al., 2020; Neumann and Calliari, 2016; Lan et al., 2020; Zacharof, 2011). The results of this research are shown in Table 2.

**Table 2: Evaluation of preventive measures**

| PREVENTIVE MEASURE             | IMPLEMENTATION COST                            | EASE OF APPLICATION                                                                               | VERSATILITY                                             | EFFECTIVENESS                                            | ENVIRONMENTAL ADAPTATION                                       |
|--------------------------------|------------------------------------------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------|----------------------------------------------------------|----------------------------------------------------------------|
| <b>Terraced slopes</b>         | <b>Low / Fair</b><br>(low construction budget) | <b>Very good</b><br>(Simple equipment, various techniques of application, fast construction time) | <b>Good</b><br>(not applicable in rocky or loose soils) | <b>Good</b><br>(reduced function in certain cases)       | <b>High</b><br>(minimum intervention in the natural landscape) |
| <b>Drainage infrastructure</b> | <b>High</b><br>(costly materials and works)    | <b>Good</b><br>(Complex equipment, specialized personnel, slow application rate)                  | <b>Very good</b><br>(applicable in most cases)          | <b>Very good</b><br>(long-term reliability)              | <b>Low</b><br>(major intervention in the landscape)            |

Assessing different evaluation methods through comparative analysis is certainly a challenging endeavor. However, there are specific distinct differences that illustrate the advantages and disadvantages of each method in relation to the others.

Based on the findings of the above research, the application of the AHP method with pairwise hierarchy was carried out. The results are shown in Table 3.

| Planting                        | 4               | 9                       | 1        | 0.708           |

The alternative prevention measures present different priorities, with regard to implementation cost, ease of application, versatility, effectiveness and environmental adaptation.

Then, a comparative ranking is made in pairs for the evaluation criteria, as shown in Table 4. The effectiveness of the appropriate measure is considered the most important criterion. They follow in hierarchical order, implementation cost, versatility, effectiveness and environmental adaptation and lastly ease of application is ranked. It is crucial to recognize that the significance of each criterion and the assessment of every prevention measure should be determined by qualified engineering professionals, taking into account the unique characteristics of each situation along with the budget and any additional limitations. If specific insights must be derived from the roadside slope, the methods that meet or do not meet the desired outcomes should be appropriately assigned relative importance weights.

**Table 4: Pairwise comparison of the evaluation criteria**

| Evaluation criteria      | Implementation cost | Ease of application | Versatility | Effectiveness | Environmental adaptation | Priority |
|--------------------------|---------------------|---------------------|-------------|---------------|--------------------------|----------|
| Implementation cost      | 1                   | 3                   | 1           | 1/5           | 1                        | 0.129    |
| Ease of application      | 1/3                 | 1                   | 1/3         | 1/7           | 1/3                      | 0.051    |
| Versatility              | 1                   | 3                   | 1           | 1/5           | 1                        | 0.129    |
| Effectiveness            | 5                   | 7                   | 5           | 1             | 5                        | 0.563    |
| Environmental adaptation | 1                   | 3                   | 1           | 1/5           | 1                        | 0.129    |

The overall weights of the prevention measures are listed in Table 5 and the results of the overall evaluation are shown in Figure 7. First is the Planting measure, second is Drainage and third is Terraced slopes. According to each scenario, adequate pairwise comparison weights should be attributed.

**Table 5: Overall weights of preventive measures**

| Preventive measure      | Priority with respect to |                     |             |               |                          | Overall priority / score |
|-------------------------|--------------------------|---------------------|-------------|---------------|--------------------------|--------------------------|
|                         | Implementation cost      | Ease of application | Versatility | Effectiveness | Environmental adaptation |                          |
| Terraced slopes         | 0.080625                 | 0.0306              | 0.018447    | 0.080509      | 0.029799                 | 0.23998 (~24%)           |
| Drainage infrastructure | 0.030702                 | 0.0102              | 0.055341    | 0.241527      | 0.00774                  | 0.34551 (~34.5%)         |
| Planting                | 0.017673                 | 0.0102              | 0.055341    | 0.241527      | 0.091332                 | 0.416073 (~41.5%)        |

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

As can be easily seen from Figure 7, the Planting measure outperforms the other two in the overall evaluation of the evaluation criteria, although it clearly outperforms only one criterion, that of environmental adaptation. In terms of effectiveness and versatility, it ranks equal to Drainage and presents the highest implementation cost.

### Sensitivity Analysis

All of the above applies in the case where there are no restrictions on the budget for the implementation of each measure. In the opposite case, that is, when financial resources are limited, then the same procedure is followed and its results are differentiated with regard to the comparative ranking of the criteria per pairs (Table 6) and finally, the optimal choice and the alternatives with their adequacy with respect to the evaluation criteria are shown in Table 7 and Figure 8.

**Table 6: Pairwise comparison of the evaluation criteria (budget constraints)**

| Evaluation criteria      | Implementation cost | Ease of application | Versatility | Effectiveness | Environmental adaptation | Priority |
|--------------------------|---------------------|---------------------|-------------|---------------|--------------------------|----------|
| Implementation cost      | 1                   | 7                   | 5           | 1             | 5                        | 0.384    |
| Ease of application      | 1/7                 | 1                   | 1/3         | 1/7           | 1/3                      | 0.041    |
| Versatility              | 1/5                 | 3                   | 1           | 1/5           | 1/3                      | 0.074    |
| Effectiveness            | 5                   | 7                   | 5           | 1             | 5                        | 0.384    |
| Environmental adaptation | 1/5                 | 3                   | 3           | 1/5           | 1                        | 0.118    |

**Table 7: Overall weights of preventive measures (budget constraints)**

| Preventive measure      | Priority with respect to |                     |             |               |                          | Overall priority / score |

|                         | Implementation cost      | Ease of application | Versatility | Effectiveness | Environmental adaptation |                          |
| Terraced slopes         | 0,24                     | 0,0246              | 0,010582    | 0,054912      | 0,027258                 | 0,357352 (~36%)          |
| Drainage infrastructure | 0,091392                 | 0,0082              | 0,031746    | 0,164736      | 0,00708                  | 0,303154 (~30%)          |
| Planting                | 0,052608                 | 0,0082              | 0,031746    | 0,164736      | 0,083544                 | 0,340834 (~34%)          |

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**Figure 8: Evaluation priorities / scores (budget constraints)**

In contrast to the results of the evaluation when there are no financial constraints, in the case where they exist, the most appropriate landslide prevention measure is demonstrated to be Terraced slopes, with Drainage coming close to the evaluation. Terraced slopes clearly excel in the criteria of implementation cost and ease of implementation, while in the rest it is far from the ideal choice.

As it is easily perceptible, the optimal result after conducting the proposed method, depends on the special characteristics and of each case and may differ from case to case. The authorized engineers of the road operator can use the proposed method as a tool to find the best alternative for the roadside slopes under inspection, so as to ensure slope stability and safety.

## Conclusions

By applying the proposed method, a specific and overall picture of the options available is created. Thus, it is relatively easy to evaluate all alternatives for decision-making. Choosing the best measure is not a one-dimensional decision, but depends on many factors.

The proposed appraisal results in an analysis of preventive measures with regards to specific criteria and helps decision makers to conclude to the optimal choice according to their priorities and potentials. The optimal choice may differ according to special characteristics of each case examined.

The common practice adopted by road managers of consistently applying the same prevention measure over the years, disregarding any flaws or resource limitations, is likely to yield inaccurate results due to insufficient implementation processes related to the evaluation procedure. The purpose of this evaluation is to highlight the overall framework within which existing methods should be assessed and is intended to serve as a comprehensive tool for road professionals to conduct alternative assessment while also considering the resources available.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

In conclusion, each measure presents its own benefits and drawbacks, which vary based on desired outcomes and financial constraints. To confidently choose the most appropriate one for landslide prevention, the approved personnel must thoughtfully consider the previously mentioned factors relevant to each situation evaluated.

Future research may be conducted in the frame of artificial intelligence integrated in the evaluation procedure, so as all special characteristics of each case will be considered thoroughly.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**Special session:**  
**CULTURE AND SUSTAINABLE URBAN DEVELOPMENT OF THE CITY**  
*powered by the **Foundation for Mediterranean Studies - MeDiterrate***

Coordinator:  
**Antonis Papagiannidis**  
*Economia Group*  
*Foundation for Mediterranean Studies - MeDiterrate*

### Abstract and Topics

This special session seeks to unravel the intricate connections between cultural heritage, urban identity, and the political economy of sustainable development. It emphasizes the critical role of culture as both a resource and a framework in fostering resilient and inclusive urban environments. Cities, as complex systems of social, economic, and political interactions, provide a fertile ground for examining the interplay between cultural dynamics and the imperatives of sustainability.

The session delves into how cultural norms, historical legacies, and socio-economic transitions shape urban governance, spatial planning, and public policy. It critically examines the urbanisation processes that disrupt traditional socio-economic structures and introduce new modes of production, consumption, and social behaviour. Particular attention is given to the pressures of rural-to-urban migration, which often entails the coexistence of diverse cultural paradigms and the challenge of integrating these into a cohesive urban framework. The session also interrogates the commodification of cultural heritage within urban economies, exploring its dual potential to drive economic growth while risking homogenisation and loss of authenticity.

The political economy dimension is central to this discussion, as the session evaluates how governance models, institutional structures, and public policies influence the allocation of resources and the distribution of opportunities in urban settings. By reflecting on both historical and contemporary examples, it highlights the potential of culturally attuned strategies to address issues of inequality, social exclusion, and environmental degradation. The session positions cities as arenas where cultural identity intersects with economic imperatives, offering a roadmap for reconciling economic growth with social equity and environmental integrity.

Through this lens, the session aims to contribute to a nuanced understanding of the role of culture in shaping urban political economies, advancing a vision of cities as spaces of sustainable coexistence and dynamic cultural exchange. This perspective encourages policymakers, researchers, and practitioners to rethink the urban experience as one that is not only economically viable but also culturally enriching and socially inclusive.

Building on the above, this session’s key areas of focus are:

- Urban Identity
- Sustainable Governance
- Healthy Cities
- Tourism and Urban Economy
- Social Cohesion
- Rural-Urban Dynamics
- Political Economy of Cities
- Public Spaces
- Cultural Resilience

### ATHENS: A CITY WITHOUT AN "URBAN" CULTURE

**Maravegias Napoleon**

*National and Kapodistrian University of Athens*

*Foundation for Mediterranean Studies – MeDiterrate*

[nmarav@pspa.uoa.gr](mailto:nmarav@pspa.uoa.gr)

#### **Abstract**

The concentration of population in Athens has led to numerous challenges affecting daily life and overall quality of living. Between 1950 and 1980, the population of the Athens urban complex more than doubled, increasing from 1.4 million to 3 million as 1.6 million people migrated from rural areas across Greece. Although the rural migration to Athens slowed in subsequent decades, it continued, and today (2024), 3.6 million people reside in the wider urban complex.

The uncontrolled expansion of Athens resulted in inadequate urban planning, causing adverse effects on transportation, construction, the social fabric, and green spaces. Natural resources have been significantly depleted, creating an unlivable urban environment. The social, economic, and environmental problems arising from urbanization, alongside the decline of rural areas, have been extensively studied. However, the behavioral patterns of people migrating to Athens—bringing their "rural" cultural norms (habits, attitudes, and perceptions) into a vastly different urban environment—remain insufficiently explored.

This analysis aims to explore the extent to which the blending of "rural" cultural norms with the fragile "urban" cultural model contributes to the behaviors observed in Athens today. These behaviors include indifference toward public spaces, urban planning disorder, transactional political engagement, varying degrees of lawlessness in an impersonal and sprawling city, as well as family solidarity, religiosity, and distrust of institutions.

**Key words:** Urbanisation, cultural transition, social behaviour, socioeconomics

### THE CONCEPT OF "SYSPONDIA"

**Chryssochoou N. Dimitris**

*National and Kapodistrian University of Athens*

[dchrys@pspa.uoa.gr](mailto:dchrys@pspa.uoa.gr)

#### **Abstract**

The term 'sympolity' denotes a benevolent bond among partner-members working toward the greater good of their shared organization. Derived from the word 'libation' (spondē), it symbolizes the communal connection formed among members of an association dedicated to a mutual and beneficial purpose, fostering a symbiotic and lasting co-evolution. This presentation draws inspiration from the ancient Greek associations of city-states, or 'sympolities,' of the Classical and Hellenistic periods. It aims to articulate the essential quality of the communal bond, as well as the constitutional foundations and implications of such associations in the contemporary context of the European Union as both a polity and a collection of polities.

Specifically, it frames the modern European Union as a political form of 'union of constitutional co-evolution,' proposing a structured collective legal and political order that, over time and through the lens of constitutional liberty, can shape its own self-recognizable 'demos' and distinctive—though unconventional compared to classical confederal unions and contemporary sovereign federal states—constitutional identity. Overall, the presentation seeks to conceptualize the European Union as a 'sympolity of late modernity,' capable of systematically developing its own framework for public coexistence among partner-members, thereby constituting a complex political entity that transcends traditional international interpretations of unions.

**Key words:** Sympolity, European Union, constitutional co-evolution

### THE PROTECTION OF THE PHYSIOGNOMY OF CITIES AND GREEN PUBLIC PROCUREMENTS

**Karnavos Dimitrios**

*PhD, Economist, Department of Economics and Sustainable Development, School of Environment Geography and Applied Economics, Harokopio University*

[d.karnavos@yahoo.gr](mailto:d.karnavos@yahoo.gr)

#### **Abstract**

Public Authorities are the main consumers in Europe, spending around 2 billion euros, that is the 14% of the European Union's GDP. They procure goods (e.g. structural elements, vehicles, equipment for public spaces in cities, etc.) and services (e.g. building maintenance, transport services, cleaning services, etc.), while at the same time implementing projects, which as a whole or individually may have potentially significant environmental impacts. With this specific condition, it becomes absolutely clear that Public Authorities maintain an important, perhaps even dominant, role in the promotion and use of Green Public Procurement. In other words, they can play an important role in reducing environmental impacts and the environmental footprint, by promoting the procurement of "greener" products, services and projects from the market.

Today, Green Public Procurement, although considered as a voluntary tool, are widely understood conceptually, but has not yet been universally implemented by Public Authorities. Nevertheless, it has been recognized that it constitutes a smart contracting. In any case, they imply an improvement in the performance of the public contract and at the same time the use of the power of the public market in order to achieve very significant environmental benefits mainly at the local level, including the protection or preservation of the city's physiognomy. In other words, they are a particularly dynamic tool for shaping the character of cities on the basis of sustainable standards, but also an excellent means for achieving local objectives and initiatives for the environment and human health. In any case, Green Public Procurement can be an effective tool for addressing urban problems at source, ensuring a high quality of life for city residents.

Considering the value of Green Public Procurement as a tool for protecting the environment and shaping sustainable and healthy cities, Member States need to be encouraged to develop their own national Action Plans for the “greening” of public procurement. Among other things, the coming years should be years of political commitments at international, European and national level.

In Greece, the first provisions on Green Public Procurement appeared in 2010 with Law 3855/2010 (Government Gazette 95 A'), but the first substantial step was taken a decade later, in 2021, when the national Action Plan for Green Public Procurement was approved with Joint Ministerial Decision 14900/2021 (Government Gazette 466 B'). However, national Public Authorities, and especially the Municipalities of our country, which constitute perhaps the largest purchasing power in goods, services and projects and the greatest shapers of the physiognomy of cities, still seem to lack significant experience and knowledge in the issues of Green Public Procurement. Therefore, highly coordinated efforts, support from the Ministries and certainly reorganization and training of the executives of the relevant Municipal Services are required, in order for the already encouraging results of the even limited use of this specific tool to find greater application for the benefit of environmental protection and the improvement of the quality of life of residents, especially of large urban centers.

**Keywords:** Green Public Procurement, city's physiognomy, sustainable and healthy cities, environmental protection

## HEALTHY CITY

**Pelegrinis Theodosios**

*National and Kapodistrian University of Athens*

[admin@pelegrinis.gr](mailto:admin@pelegrinis.gr)

### Abstract

The Athenian city, as noted by the 4th-century BC Attic writer Melanthius, has endured through history largely because of the diversity of opinions among its orators. This variety of perspectives ensured that no single view went unchallenged, allowing individuals to freely express their thoughts and, in doing so, counterbalance potentially harmful ideas. This ethos of debate underpins the grandeur of Greek civilization, epitomized by its greatest contributions: philosophy, tragedy, and democracy - each reaching its zenith in 5th-century Athens.

At the heart of philosophy, tragedy, and democracy lies the principle of dialogue: the ability to express one's thoughts while acknowledging the irrevocable right of others to disagree. Philosophy thrived in schools where members were not bound to accept the teacher's beliefs or conform to others' views. Instead, they were free to either embrace or question ideas through discussion. In fact, the greatest critics of leading philosophers were often their own students - Anaximander questioned Thales, Cratylus critiqued Heraclitus, and Aristotle challenged Plato.

Similarly, in tragedy, the characters do not merely tell stories; through their actions on stage, they engage in dialogue, sometimes converging and at other times diverging in their views. Likewise, democracy established a system of governance rooted not in power or ancestry, but in dialogue among citizens, adopting the majority's views while safeguarding the minority's right to dissent.

**Key words:** Dialogue, civilisation, democracy

# CULTURAL HERITAGE AND SUSTAINABLE URBAN TRANSFORMATION: A CONTINUUM FROM ANTIQUITY TO MODERNITY

**Konstantatos Ioannis**

*Elliniko - Argyroupolis Municipality,  
Greek Network of Resilient Cities*

## Abstract

The historical and cultural heritage of the Elliniko – Argyroupolis Municipality constitutes an integral element of its identity, stretching from antiquity to modern times. In ancient Athens, the local population fostered a progressive culture rooted in arts and philosophy, with theaters and public gatherings serving as cornerstones of collective and intellectual activity. Elliniko – Argyroupolis Municipality, established as refugee settlements by Pontic Greeks, preserved this rich cultural lineage. Over recent decades, the city’s history has been interwoven with the operation of the international airport in Elliniko, a landmark that catalyzed regional development. Today, this area is undergoing a transformative redevelopment project of iconic significance.

In the present era, this cultural legacy underpins the municipality’s commitment to sustainable urban development, balancing respect for historical traditions with contemporary progress. The municipality actively integrates environmental conservation with artistic endeavors through projects aimed at enhancing the quality of urban life. These include the regeneration of public spaces, preservation of the natural environment -particularly the Hymettus mountain range- connection to the coastal front, and initiatives promoting recycling, energy efficiency, and cultural festivals. Collectively, these efforts position Elliniko - Argyroupolis Municipality as a model of harmonized cultural preservation and sustainability.

A notable innovation is the municipality's commitment to sustainable urban mobility, exemplified by the deployment of Greece's first electric municipal transportation network. Featuring a fleet of electric vehicles, seven transit stations, and 44 electric bicycles -including an accessible model for individuals with disabilities- this initiative pioneers environmentally friendly transportation solutions. Complementary actions include public awareness campaigns on sustainable mobility, efforts to minimize ecological footprints, and strategies supporting climate neutrality.

Elliniko - Argyroupolis Municipality is also the sole municipality in Attica participating in the "Living Streets" program, alongside six other European cities. This initiative allows residents, particularly younger generations, to experience a more human-centered and neighborhood-focused urban environment.

**Key words:** Cultural heritage, Sustainable development, Urban regeneration, Green mobility, Community engagement

### URBAN ENVIRONMENT: A STRATEGIC APPROACH TO CLIMATE RESILIENCE

**Galanopoulou Eleonora**

*Nea Smyrni Municipality Commissioner for Environment, Environmental Planning, Recycling and Citizens' Resilience to Climate Change*

[noragalano@yahoo.gr](mailto:noragalano@yahoo.gr)

#### **Abstract**

Cities are increasingly bearing the brunt of climate change, as evident in the rising frequency of extreme weather events, prolonged heat waves, sea level rise, and escalating risks to food and water security. These phenomena exacerbate existing social and economic inequalities. While urban areas are significant contributors to climate change, accounting for nearly three-quarters of global emissions, they also serve as hubs of innovation and sustainable practices. Cities can play a pivotal role in reducing emissions and enhancing resilience through climate investments, ambitious urban planning, and robust policy frameworks.

Drawing on examples from the Municipality of Nea Smyrni, which aims to achieve climate neutrality by 2030, this commentary highlights a strategic approach to climate adaptation, proposing an integrated yet autonomous climate action plan that incorporates climate risk into all urban and sectoral planning policies. Initiatives for green and resilient infrastructure include, among others, enhancing urban green spaces to mitigate urban heat island effects, improving building energy efficiency, promoting low-carbon transport, and advancing sustainable waste management. These efforts not only address climate challenges but also improve quality of life, foster social equity, and promote democratic governance.

The adaptation process must avoid fragmented solutions and instead adopt a holistic planning framework to prevent the transfer of risks from one sector or activity to another. A comprehensive approach, grounded in local conditions, ensures that existing vulnerabilities are addressed effectively and equitably.

**Key words:** climate change, climate neutrality, urban resilience, Municipality of Nea Smyrni, green policies

**Special session:**  
**CULTURAL SUSTAINABILITY *IN PRAXIS*:**  
**DIGITAL TRANSFORMATION AND GREEN INNOVATION**

Coordinators:

**Vassilis Bokolas**

*Coordinator, Scientific director of XENIOS POLIS, Neapolis University Paphos*  
[vbokolas@xeniospolis.gr](mailto:vbokolas@xeniospolis.gr)

**Andrea Colantoni**

Associate Professor at University of Tuscia, Department of DAFNE (*Università degli Studi della Tuscia Viterbo*)  
[colantoni@unitus.it](mailto:colantoni@unitus.it)

In recent years, culture has been dynamically linked to the concept of sustainability. On the one hand, European Union policies relate the cultural sector to economic progress and the needs of the markets. On the other hand, the ongoing digital transformation, the demand for modern skills and the need for green innovations are broadening and enriching the field of cultural actions and developing good practices with a focus on social support and progress. In this context, universities, research institutes, museums, businesses, social bodies, etc. are looking to European funding and international cooperation to develop modern research and good practices that respond to real problems and needs.

The special session will focus on the sustainable development of cultural sector with emphasis in local, regional and urban level and more specifically at the following key topics:

- Climate change and digital media
- Cultural industries and social needs
- Digital communication and learning skills in the working environment
- Digital health and social development
- Digital tools and vulnerable groups
- Gender in the digital world
- Green solutions in urban environments
- Humanities and digital transformation
- Local and Regional Development and Green innovation
- Sustainability and European-funded projects
- Urban Reconstruction and cultural sector

[eirpapadaki@hmu.gr](mailto:eirpapadaki@hmu.gr)

## Abstract

Culture is an important pillar of development for every country. In addition, the link between cultural heritage and tourism is, according to Anholt, a distinct dimension of the “nation brand hexagon”, an important element of place and destination brands. Creative Industries (CIs) as a modern cultural field include production units that focus on human talent, individual craftsmanship and the ability to create original products that can lead to a comparative economic advantage. The link between CIs and the tourism industry is eloquently reflected in modern forms of alternative tourism, such as cultural and creative tourism, where visitors come into contact with cultural resources and/or interact with the inhabitants of the destination. At the same time, the digital transformation of tourism is taking place, which is progressively linked to the -perhaps more robust- field of CIs, digital games. The importance of this field is recognised by the EU, which, by establishing and adopting legislation and conducting international surveys (2023, 2024), is attempting both to regulate the sector and to highlight the economic, social and cultural dimension of digital games.

This study is based on a broad literature review. It utilises classification, analysis and interpretation of secondary data to outline the emerging relationship between tourism and digital, online games. Massively Multiplayer Online role-playing games (MMOs) have been described as harbingers of the metaverse as they offer a first insight into the future fully functional cross-platform reality. The dimension of the metaverse as a 'meeting place' between the physical and digital worlds is familiar to gamers, who spend a lot of time in game fora. In these 'third places', communities of players meet, connect, communicate and develop social practices, laying the foundations of so-called metaverse gaming. International surveys (2021, 2023) on MMOs and popular platforms (Roblox, Fortnite, Minecraft) have shown that 60% of players participate in parallel activities (not directly related to the game itself): meeting new people, watching videos, participating in live events, going on tours, organising trips to the virtual or real world, attending educational programmes, etc. Recent research concludes that both the choice of tourist destinations and the enhancement of experiences and perceptions of these destinations are linked to the activity of the player and the types of games used. Other studies focus on the development of digital games in tourism destinations, with an emphasis on interactive entertainment, sport and educational experiences. Finally, it is considered that the development of the relationship between the tourism industry and the digital games sector can benefit the industry, on the one hand by the emergence of new business models and the promotion of the tourism product, but also by expanding the possibilities to reach larger audiences - especially young people - and by the consequent development of (digital) accessibility.

**Key words:** creative industries, culture, tourism, digital online games, metaverse gaming

### **BRIDGING THE GENDER DIGITAL DIVIDE: STRATEGIES FOR INCLUSIVE TECHNOLOGY ADOPTION IN MARGINALIZED COMMUNITIES IN UGANDA**

**Nagasha Judith Irene**

*Kyambogo University, Uganda*

[judith.nagasha@gmail.com](mailto:judith.nagasha@gmail.com), [jnagasha@kyu.ac.ug](mailto:jnagasha@kyu.ac.ug)

#### **Abstract**

Digital divide continues to pose notable challenges among marginalized communities in Africa, with a notable gender disparity, in countries like Uganda. This disparity has impeded both social and economic development within communities. This study aims to explore the primary factors driving the gender digital divide, examine barriers to technology adoption faced by women in marginalized communities, assess the influence of cultural norms and gender roles on the gender digital divide, and evaluate strategies for fostering inclusive and user-friendly technology adoption. The research seeks to contribute to the theoretical and conceptual discourse on gender equity in technology adoption, and women's empowerment. The study will be grounded in Kabeer's empowerment framework and the theory of change. It will employ a mixed-methods approach, integrating both qualitative and quantitative research methods. The qualitative component will include focus group discussions, interviews with key informants, observations, and photography-based techniques for data collection. The quantitative aspect will utilize structured questionnaires to gather relevant data. The findings will inform policy recommendations and provide actionable insights for the marginalized communities and key stakeholders. Specifically, the study will emphasize the active participation of marginalized communities in technology adoption decision-making processes and the development of strategies that prioritize inclusivity. Additionally, it will propose community-based training initiatives based on the theory of change to address gender-specific barriers to digital literacy to ensure sustainability.

**Key words:** Gender, digital divide, technology

*Prof.Assoc. Dr. European University of Tirana, Albania*

[ketrina.cabiri@uet.edu.al](mailto:ketrina.cabiri@uet.edu.al)

#### **Abstract**

This research thesis investigates the role of academia-industry collaboration in research and development (R&D) as a critical driver for addressing economic challenges and fostering innovation and sustainable economic growth, with a focus on Albania and Kosovo. Both countries, emerging from transitional economies, face significant challenges in maintaining sustainable economic growth, addressing high unemployment rates, and fostering innovation.

The study explores how partnerships between universities and industries can bridge the gap between academic research and industrial needs, with a focus on sectors critical to regional development. By leveraging the research capacities of academic institutions and the practical, market-oriented knowledge of industry, such collaborations can drive innovation, boost competitiveness, and contribute to socio-economic development.

The study explores how partnerships between universities and industries can bridge the gap between academic research and industrial needs, with a focus on sectors critical to regional development. By leveraging the research capacities of academic institutions and the practical, market-oriented knowledge of industries, such collaborations can drive innovation, boost competitiveness, and contribute to socio-economic development.

Findings from this research will provide recommendations for strengthening academia-industry ties, enhancing R&D capacities, and informing policy initiatives aimed at creating a sustainable innovation ecosystem in the Western Balkans. This thesis ultimately aims to contribute to the broader discourse on the role of knowledge economies in fostering regional development and resilience in transitioning markets

**Key words:** academia-industry collaboration, research and development, innovation, economic challenges, sustainable growth, WB, leverage research.

[gekoulierakis@uniwa.gr](mailto:gekoulierakis@uniwa.gr)

## **Abstract**

Migration to urban centers is becoming increasingly common as individuals seek better quality of life, improved job opportunities, and greater access to urban infrastructure. In this context, the World Health Organization (WHO) highlights the importance of addressing the health of migrants and refugees as a critical aspect of public health. This review examines the Health-Related Quality of Life (HRQoL) and Professional Quality of Life (ProQOL) of migrants living in urban settings across the European Union. It emphasizes the implications for migrant integration, public health policy, and urban planning. Following the PRISMA guidelines for systematic reviews, the research reveals a complex relationship between migrant status, incomplete integration, and various socioeconomic and health-related challenges that affect both HRQoL and ProQOL. Existing literature indicates that language and cultural barriers significantly hinder social integration, exacerbating vulnerabilities and limiting migrants' ability to navigate their new environments. As a result, many migrants experience increased marginalization and discrimination from local populations, who may perceive them as competitors for limited resources. This negative perception diminishes the

## PROCEEDINGS

---

quality of life for migrants and restricts their access to essential urban services such as housing, healthcare, and employment opportunities. Evidence suggests that many migrants find themselves trapped in precarious, low-status jobs characterized by inadequate pay and job insecurity. This situation heightens their susceptibility to health-related issues and undermines their ProQOL. The analysis underscores how these dynamics create ethno-racial hierarchies of exclusion, complicating the integration process and reinforcing cycles of disadvantage. In response to these findings, the review calls for targeted public health strategies and policy interventions to address the diverse challenges faced by migrant populations. The ultimate goal is to improve their HRQoL and ProQOL in urban areas. This paper underscores the urgent need for comprehensive policies that consider the distinct health and social determinants impacting migrants.

**Key words:** migrants, Health-Related Quality of Life, Professional Quality of Life, integration, exclusion, cities

# GREEN ROOFS CONCEPT REVIEW: STRATEGIC COMMUNICATIONS FOR TECHNICAL AND ENVIRONMENTAL SUSTAINABILITY

**Colantoni Andrea**

*Associate Professor, University of Tuscia, Department of Agriculture and Forest Sciences, Viterbo, Italy*

[colantoni@unitus.it](mailto:colantoni@unitus.it)

**Nosova Bogdana**

*Associate Professor, Taras Shevchenko National University of Kyiv, Educational and Scientific Institute of Journalism, Department of Social Communications, Kyiv, Ukraine*

[b.nosova@knu.ua](mailto:b.nosova@knu.ua)

**Skarpelos Yannis**

*Professor, Panteion University of Social and Political Sciences, Department of Communication, Media and Culture, Athens, Greece*

[gskarp@panteion.gr](mailto:gskarp@panteion.gr)

## Abstract

Green roofs have emerged as a pioneering solution to numerous environmental challenges, reshaping urban landscapes across Europe. In recent years, Europe has witnessed a surge in the adoption of green roofs, driven by a confluence of factors including the pressing need to mitigate climate change, enhance urban biodiversity, improve air quality, and manage stormwater runoff. This eco-friendly roofing innovation involves the installation of vegetated systems atop buildings, effectively transforming barren rooftops into thriving ecosystems. While the concept of green roofs traces back to ancient times, modern advancements in technology, materials, and design have propelled Europe to the forefront of this green revolution.

At the heart of the international Erasmus+ GREENO2 Project (“*Green Roofs in higher education institutions as sustainable cEnters for research, participation, ENvironmental consciousness and O2 generation*”) lies the imperative to amplify its impact and reach through several tools. Among them, the use of strategic communications principles for high-quality and effective communication of GREENO2 Project partners with student and teaching communities is very important. Strategic communications guide and coordinate efforts to engage with key stakeholders and the large public, to whom the results of this project are addressed. Strategic communications contribute to a deep understanding, encourage active participation and, ultimately, stimulate actions towards sustainable development and implementation of green roof technologies. Through joint initiatives, educational programmes and transparent strategic communications, the GREENO2 Project aims to create a cohesive community focused on the development of green infrastructure and promoting environmentally responsible urban development.

In this study we defined a technical review on the state of art of green roofs. By actively communicating with project participants, students, faculty members and university staff, we also described a green roof prototype developed by researchers at the Nello Lupori Educational and Experimental Farm of the University of Tuscia in Viterbo (Italy) in the frame of the GREENO2 Project.

**Key words:** green roofs review, technical aspects, strategic communications, sustainability, environmental challenges

## Abstract

The world of work is rapidly changing, driven by the relentless march of digitalization. Even before the COVID-19 pandemic threw everything into overdrive, employers were struggling to keep pace, searching for ways to upskill their workforce for emerging technologies and new business models (Cedefop, 2021). This situation has made it crystal clear that our education systems need to step up and better prepare students for a digital-first work environment, equipping them with the skills they need to thrive.

Another key trend is the growing popularity of freelance and “gig” work, much of it facilitated by digital platforms. Over the past decade, more and more workers, including many bright young graduates, have been drawn to freelancing or self-employment, attracted by the promise of flexibility and control over their careers. Europe’s freelance workforce is estimated at around twenty million people, representing roughly 8–9% of the total workforce (Talent Monitor). While this share has remained fairly stable recently, younger folks under 30 still make up only a small slice of the freelancer pie (Talent Monitor). Many new graduates hesitate to jump into freelance careers right after university, and it’s not hard to see why. They face barriers like a lack of business know-how, limited professional networks, and uncertainty about how to find clients. However, encouraging entrepreneurial ventures and freelancing among young people is seen as a way to spark innovation and tackle graduate unemployment.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

So, ensuring that graduates possess both the digital skills and the entrepreneurial savvy to succeed as independent workers is becoming a vital goal for higher education.

To reduce the gap between what’s taught in classrooms and what’s needed in the digital labor market, we need new and fresh approaches to pedagogy, curriculum design, and career development services. Universities are increasingly expected to team up with businesses and policymakers to make sure learning outcomes match real-world skill needs. Universities are tackling this challenge through work-integrated learning, industry projects, and targeted training courses in digital and professional skills. The European Commission's Digital Skills and Jobs Coalition emphasizes that all sectors (public, private, educational) should work together to upscale skill development, promoting multi-stakeholder partnerships to close the digital skills gap.

The Digital Freelancing (DiFree) idea originated in exactly this environment. Under co-funding by the Erasmus+ program (2022–2025), DiFree is a transnational initiative including Italian, Spanish, Greek, Portuguese universities and research partners. Emphasizing freelancing and self-employment especially, DiFree seeks to "build bridges" between academic knowledge and the skills needed in the digital labor market. Stated differently, it aims to give recent graduates and students the targeted skill development chances they need to flourish in the realm of digital freelancing. The results of the DiFree program are presented in this paper together with an examination of its approach in the larger framework of digital skills and professional development. Analyzing DiFree's goals, programs, and outcomes can help us to find practical means of bringing digital technologies and entrepreneurial skill-building into higher education.

This paper is organized as follows: We will first give a synopsis of pertinent policy background and literature including digital skills development, entrepreneurial education, labor market changes, the function of creative hubs and career services. We will then discuss our approach, stressing how data from the DiFree software and associated sources were compiled and examined. We will then highlight important findings from the DiFree case study—the objectives of the program, the tools and resources it produced, and how it affected graduates and active participants. These findings will be examined in view of the body of current research, and we will derive policies and educational practice recommendations. At last, the conclusion will list the salient features and provide recommendations for next research and initiatives meant to close the gap between academic knowledge and the expectations of the digital labor market.

**Key words:** digital skills, european programme, education and training, labor market

## Literature Review

### *Digital Skills Development and Gaps*

Apart from swift technological development, the demand for digital skills in the job market is continually growing. Now considered as fundamental as reading or arithmetic is digital literacy, the ability to boldly use computer tools and services. Surveys frequently illustrate

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

how vital digital skills are to recent graduates, even in fields unrelated to conventional IT. For example, a recent corporate study noted that among the most important skill shortages noted in recent graduates entering digital contexts are communication and teamwork (Tee et al., 2024). Studies usually rank digital content production, safety (cybersecurity awareness), digital communication and collaboration, digital information and data literacy, and problem-solving as the most important digital skills. Creating engaging digital content, including video, is also becoming more crucial and calls both media literacy as well as technical knowledge (Kaperonis, 2021).

The rapid development of artificial intelligence is further complicating things by changing how businesses connect with their consumers. This underlines how basic artificial intelligence literacy should be based on digital capability. Kaperonis (2024) underlines that awareness of how AI is altering the User Experience in Digital Marketing is very crucial since AI-driven solutions are used for personalized content, automate marketing duties, and deliver important, data-driven insights. If digital marketers are to remain competitive, they have to keep up with novel ideas include using AI for search engine optimization, social media marketing and content creation (Dwivedi et al., 2023).

Reflecting the five competency areas set by the DigComp framework of the EU, these categories offer a shared basis for what it means to be digitally competent. Although "communication and collaboration" are expected to become even more important in the near future, a study in an Industry 4.0 environment indicated that "information and data literacy," "digital content creation," and "problem-solving" are currently the most sought-after digital abilities. It's worth noting that the largest skills gaps identified were in those "soft" digital skills. Employers reported that graduates often lacked strong communication and collaboration skills, as well as sufficient digital safety awareness. These findings suggest that educational programs need to go beyond simply teaching technical ICT skills. They must also cultivate the soft skills and digital mindset required to effectively use technology in teams and business processes. The European Digital Competence Framework (DigComp) has been widely adopted to guide digital skill development initiatives, outlining a progression of proficiency levels (from foundational to advanced) across key competencies. However, implementing such frameworks in higher education can be challenging. Many university programs still seem to assume students will pick up digital skills on their own, which may not be enough to meet the demands of the labor market.

The COVID-19 pandemic dramatically highlighted both the importance of digital skills and the potential consequences of skills gaps. With the sudden shift to remote learning and remote work, students and workers who were digitally savvy were able to adapt much more easily, while those lacking digital skills faced significant challenges. The pandemic accelerated the demand for digital skills in many occupations, even those outside of traditional IT (Cedefop, 2021). Teachers, office workers, and professionals in various fields had to quickly improve their digital tool usage to keep things running during lockdowns. As a result, educational institutions are now integrating digital competencies more explicitly into their teaching, with a stronger emphasis on digital skills certification for students, investments in educational technology, and teacher training in digital pedagogies.

Despite this progress, disparities persist. Digital skill levels often vary significantly by region, age group, and socioeconomic background (Cedefop, 2021). This means that any

## PROCEEDINGS

---

solution to the skills gap must be inclusive, ensuring that everyone has opportunities to develop these vital competencies. For universities, this could involve offering extra digital skills workshops for students in non-technical fields and providing personalized support to those who may have lower initial proficiency.

### ***Entrepreneurship Education and Self-Employment***

Along with digital skills, entrepreneurship education has grown in importance in academia as teachers try to equip their students for a constantly shifting professional path. Entrepreneurship education is the instruction in knowledge, skills, and attitudes required to start and run new businesses or to be entrepreneurial inside current companies. Training in opportunity assessment, company planning, financial literacy, innovation, and fundamental soft skills including creativity and leadership is also quite important.

Encouragement of entrepreneurship in higher education serves two primary purposes. First of all, developing an entrepreneurial attitude helps graduates to be more generally employable. Companies highly reward initiative, adaptability, and problem-solving even if they do not launch their own companies. Second, formal entrepreneurship education helps students who select self-employment or startup routes increase their odds of success and inspire more to investigate these choices. In areas suffering significant youth unemployment, where enabling young people to start their own businesses becomes a strategic focus, this is especially pertinent.

Empirical research consistently supports the positive impact of entrepreneurship education. A meta-analysis of 36 studies (involving nearly 30,000 students) found that participation in entrepreneurship education is significantly associated with higher entrepreneurial intentions among college students. In other words, students who receive entrepreneurship training are more likely to plan to start their own businesses or pursue self-employment, particularly in environments where such careers are supported. The meta-analysis noted that the strength of this effect can vary from country to country, but the overall relationship is still a positive one. This indicates that well-designed educational interventions can indeed foster an entrepreneurial spirit and motivate more graduates to pursue innovative ventures or freelance careers.

The European Commission’s EntreComp framework provides a broad definition of entrepreneurship competence as the ability to act upon opportunities and ideas to create value for others, whether that value is social, cultural, or economic. EntreComp breaks this down into 15 key competencies (such as spotting opportunities, mobilizing resources, taking initiative, and learning through experience) across the areas of Ideas & Opportunities, Resources, and Into Action. The framework is intentionally holistic, emphasizing that entrepreneurship is not just about business creation but also about creativity, problem-solving, and the ability to mobilize others. For higher education, EntreComp provides a useful blueprint for curriculum development. Courses and programs can align learning outcomes with EntreComp competencies to ensure that students are developing the relevant skills.

To encourage students to create entrepreneurial enterprises, many colleges have added entrepreneurship classes, innovation laboratories, incubator programs, and mentoring initiatives. Experiential learning elements, such as starting a company in a capstone project,

## PROCEEDINGS

---

advising for a real small firm, or participating in hackathons, often find their way into these programs. Such practical exercises allow students to engage in controlled risk-taking and creative expression. Involving business leaders and entrepreneurs as mentors or guest speakers also provides students with valuable insights and relatable role models. Entrepreneurship education can be particularly valuable for graduates seeking freelancing jobs, as they are essentially independent entrepreneurs offering their skills and services. Freelancers need to market themselves, handle client relationships, manage legal and financial matters, and constantly find innovative ways to deliver their services. These tasks reflect many facets of running a small business. While traditional entrepreneurship classes might not specifically focus on freelancing, the core entrepreneurial skills are equally applicable to independent professionals and gig economy workers. Understanding how to identify market needs, build a personal brand (analogous to a corporate brand), manage project finances, and leverage networks can be incredibly helpful for a freelancing graphic designer or software developer.

### ***Digital Labor Market Trends and Higher Education Response***

The digital transformation of the economy has introduced new labor market dynamics that universities need to consider. One major trend is the increasing importance of continuous learning and upskilling throughout one's career. The “half-life” of technical skills is shrinking. Technologies can become obsolete in a matter of years, so workers need to regularly acquire new skills to stay relevant. This reality is prompting a shift in how we view higher education, moving away from a one-time preparation for a lifelong career and toward the foundation for lifelong learning. Universities are gradually incorporating more emphasis on learning agility and digital learning skills (for instance, knowing how to independently pick up new software or a new programming language). Some institutions are establishing alumni upskilling programs and micro-credential courses, so graduates can return and update their skill sets.

The labor market is also experiencing a blurring of boundaries between traditional employment and self-employment. Many professionals now pursue mixed careers, starting in a salaried job and then moving to freelancing, or vice versa, at different points in their lives. Recent research has noted that the proportion of self-employed workers in the EU hasn't really increased over the past decade. In fact, it slightly declined from 15.4% to 13.7% between 2010 and 2022 (Eurofound, 2024). This indicates that, while interest in freelancing and gig work is definitely there, structural challenges and uncertainties might be limiting growth in this area. These changes call for career guidance and professional development training that are versatile and able to support individuals through career transitions.

For young graduates, entering the workforce can be particularly challenging if they're aiming to join the freelance economy. As we mentioned earlier, relatively few new graduates immediately start their own businesses or work as freelancers. However, a supportive ecosystem can definitely make a difference. Universities are increasingly partnering with industries and creating freelancer support programs, such as freelancing workshops, career services tailored to independent work, and networking events that connect students with freelance professionals. These efforts strive to demystify freelancing as a career option and provide students with the tools and contacts they need to get started. Early intervention can

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

build confidence, and individuals who receive entrepreneurial training and mentoring often feel more capable of starting their own ventures.

### ***Creative Hubs and Career Services in Higher Education***

A notable development in this evolving ecosystem is the emergence of creative hubs and the transformation of university career offices into modern career development hubs. Creative hubs broadly refer to spaces (physical or virtual) that facilitate collaboration among creative and entrepreneurial professionals. Digital freelancing, as part of the creative economy, is strongly related to hubs, under whatever title they bear: co-working spaces, studios, incubators, accelerators, districts, quarters or zones, to name but a few. Pratt, Virani and Gill (2019, p. 2) notice that despite the widespread credo in the importance of creative hubs, academic research about them is scarce while “there exists a kind of unquestioned faith in hubs – despite – or more tellingly perhaps because – their meaning is not always clear.” They are immersed into the everyday working practices (including networking) of cultural workforce including (digital) freelancers, due to the structural and organizational changes in those sectors since the 1990s. In several cases, universities operate creative hubs to facilitate industry-academia collaboration. Examples include the Digital Creativity Labs at the University of York and the CoAST Research Group at Canterbury Christ Church (Ashton and Comunian 2019).

On the other hand, career services in higher education have undergone significant transformations over the 20<sup>th</sup> century, shaped by socioeconomic changes, technological advancements, and generational shifts. From vocational guidance in the early 1900s to job placement initiatives in the post-WWII decades and career counseling in the 1970s and 1980s, each phase reflected the evolving needs of students, employers, and institutions. Since the 1990s, career services evolved from the traditional job placement model into networking hubs that integrate employer engagement, digital tools, and community-based career development (Dey and Cruzvergara 2014). During this period, career services transitioned from being a primarily advisory function to proactively engaging with corporate recruiters, alumni networks, and external stakeholders.

The 2008 global financial crisis intensified debates about the return on investment (ROI) of higher education. Universities faced increased pressure from students, parents, policymakers, and employers to demonstrate tangible career outcomes. This era also saw career services expand beyond transactional services (e.g., job postings, career fairs) to relationship-based engagement through employer partnerships, mentoring, and experiential learning opportunities. The traditional career office model – where students passively sought help with résumés and job applications – became outdated. The 2010s and early 2020s ushered in the career hub model, which emphasized community-based career support networks, where students, alumni, faculty, and employers interact in structured ways; career services as facilitators rather than direct job matchmakers; Personalized career pathways, using AI-driven career advising tools; Lifelong career support, expanding services to alumni long after graduation.

In this new model, career services became embedded into the university’s culture rather than existing as an isolated office. Universities such as Stanford, University of Chicago, and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Wake Forest led the shift by rebranding career services into integrated career ecosystems. The concept of hubs represents a network-centric model where career centers facilitate connections rather than merely providing information. Thus, the hub-based model aligns with the changing job market, where career paths are nonlinear, interdisciplinary, and reliant on lifelong learning. Even more, it is expected that university career centers will become lifelong career partners, providing continuous upskilling and reskilling services, as well as career services for life.

### ***Combining Hubs and Career Services in Higher Education: The DiFree physical and digital Hub***

The DiFree project<sup>7</sup> proposed – among others – the creation of a specialized Freelance Hub, where the target groups will find accurate and reliable information, guidance, mentoring programs, opportunities for life-long training, upskilling and reskilling. It was expected to focus on transversal competencies and soft skills providing students and graduates with a space to meet, share knowledge, organize gatherings and events, invite personalities from the freelance community, etc. In other words, the vision was incorporating the framework envisioned for the future of higher education career offices, organizing an ecosystem where exchange of experience and experiential learning would proliferate, and technology would play a pivotal role.

The Hub is installed physically within Panteion University’s career office, adding value to its services to students and recent alumni, as well as to the students and alumni of the University’s Lifelong Learning Center, and opening it to an external public interested in freelancing. It also adds value to the services provided to stakeholders such as companies and organizations of the private and public sectors. It is complemented by a digital Hub,<sup>8</sup> offering access to the project’s outcomes such as an e-book on Freelancing in the partners’ countries, online courses on freelancing, or a self-evaluation and self-vocational online assessment tool developed by the Universidad de Cádiz. It is also providing links to resources regarding freelancing in the participant countries, as well as the opportunity to arrange either in-person or online counseling by Panteion University’s career office.

## **Conclusion**

As the pace of digital skills requirements in career development is evolving, educational institutions and especially Higher Education Institutions face new challenges. They include the introduction of entrepreneurship and ‘soft’ digital skills into the curriculum and providing opportunities to their students to get familiar with a changing vocational ecosystem. In this ecosystem career offices may contribute by providing information and mentorship, not only to their traditional inner publics, but also to external publics as well, leading to extrovert functions and services, opening up the Higher Educations to their corresponding communities. DiFree has created a model Hub, both physical and digital, to support such functions. Its

#### **Abstract**

The European Union considers misinformation and fake news as a serious threat to democracy and social cohesion, especially in times of elections, health crises (e.g. pandemics) and more generally, in terms of understanding crucial phenomena (climate change, migration). To meet this situation, coordinated action by Member States, institutions and the media is needed. Against this challenge, the EU has developed a number of initiatives to manage the phenomenon. Among other things, a Transparency centre for monitoring the content of online platforms (such as Facebook, Twitter, etc.) and an independent observatory (European Digital Media Observatory-EDMO) have been set up to tackle misinformation online and protect users from false information.

More specifically, however, misinformation in health becomes a major threat, as it affects people's trust in science, undermines public health but also endangers the personal well-being of the individual. False claims about diseases or treatments can lead to dangerous practices or avoidance of scientifically based solutions (e.g. vaccines). The EU promotes the fight against these phenomena by supporting transnational projects aimed at reducing misinformation as well as increasing transparency on digital platforms.

The purpose of this paper is twofold. At a first level, it attempts to draw data from the ERASMUS+ PROJECT and CORDIS EU RESULTS platforms and to outline the 'landscape' of European funding with regard to programmes that address health misinformation, strengthen health literacy and contribute to the sustainability of public health. On a second level, it presents the results of the integrated European programme, FATOS2U, which aims to train young people to identify and evaluate reliable sources of information, especially in times of social and health crises. This programme enhances young people's participation in society by promoting critical thinking and responsible use of digital media, providing an integrated learning programme, multifunctional digital resources and tools, thus helping to protect public health.

Finally, the present effort highlights the need for cooperation between public and private bodies, scientific organisations and companies to ensure the provision of accurate and reliable information to citizens on the one hand and to develop initiatives to combat false or misleading health news through the development of digital literacy skills for all citizens on the other.

**Key words:** misinformation, sustainability, public health, digital health literacy

---

### Introduction

One of the biggest challenges of the digital age is the spread of misinformation and fake news. With the speed of Internet dissemination, these phenomena affect democracy, social inclusion, and public health. Health Literacy is crucial because it is the key to understanding and using health information correctly. Without it, people cannot make informed decisions about their health. According to Bitzer and Ernstmann (2019), “Health literacy is the extent to which individuals are able to find, process and understand from educational, social and/or health systems health information relevant to making appropriate health-related decisions.” However, digital literacy in health is very important because all information is now available online. If we don't know how to evaluate sources, misinformation can seriously impact our health. According to Law and Woo (2018), “Digital literacy is the ability to access, manage, understand, integrate, communicate, evaluate and create information securely and appropriately through digital technologies for employment, decent jobs and entrepreneurship. It includes competencies variously referred to as digital literacy, ICT literacy, information literacy and media literacy.”

Recent studies emphasize that health-related fake news on social media continues to be a significant threat to both individual health and public trust. According to Melchior and Oliveira (2022), the majority of misinformation spreads through platforms like Twitter, YouTube, and Facebook, highlighting the urgent need for better tools and strategies as well as stronger engagement by health professionals online. In parallel, Vasist and Krishnan (2023) note that fake news also hinders sustainability-focused innovations, making it more difficult to promote and implement effective solutions in health and environmental contexts.

Beyond policy measures, technological solutions are also being explored. For instance, Lara-Navarra et al. (2020) proposed a semi-automated system for detecting fake health-related news, using user behavior analysis from Twitter and dynamic knowledge graphs. This approach illustrates the potential of AI-driven tools to support public health efforts by enabling more accurate tracking and validation of online information. Recent literature also highlights the role of explainable AI in fake news detection. Yuan et al. (2023) emphasize the need for human-centered models that combine insights from AI, communication science, psychology, and linguistics. Their approach promotes a more sustainable and transparent way of managing digital content, highlighting the value of interdisciplinary cooperation.

### European Union Initiatives and Policies

The European Union has developed several initiatives to combat disinformation. These actions aim to improve digital literacy, strengthen cooperation between organizations, and create guidelines for a safer digital environment. The Digital Education Action Plan (2021–2027) was launched in 2020 and includes guidelines to empower teachers in cultivating digital literacy and combating misinformation, with a special focus on health (European Commission, 2023). The Action Plan against Disinformation focuses on strengthening the EU's capacity and cooperation to fight misinformation (European Union, 2018). The Communication - Tackling online disinformation: a European approach presents tools to counter the spread of misinformation and safeguard EU values (European Commission, 2018). The Action Plan for

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

European Democracy includes guidelines on the obligations and accountability of online platforms in the fight against misinformation (European Commission, 2020).

The European Digital Media Observatory (EDMO) is an independent observatory bringing together fact-checkers and academic researchers with expertise in online disinformation, social media platforms, journalist-driven media, and media literacy. Since early 2023, six new national and regional hubs of EDMO have been operating, covering countries such as Bulgaria, Germany, Estonia, Greece, Croatia, Cyprus, Latvia, Lithuania, Hungary, Malta, Austria, Romania, and Slovenia (European Commission, 2024a). The 2022 Code of Practice on Disinformation brings together a wide range of actors to engage in voluntary actions to counter misinformation (European Commission, 2025). The European Declaration on Digital Rights and Principles includes commitments to fight misinformation and promote a safe digital environment (European Commission, 2022). Lastly, Global Media and Information Literacy Week (2024) is a campaign taking place from 24 to 31 October, aiming to strengthen critical thinking and media literacy among citizens (European Commission, 2024b).

The European Union has no direct responsibility for health policies or for the organisation and delivery of health services. However, it plays a complementary role by supporting the national policies of the Member States and promoting cooperation in the field of public health (European Council, 2024).

European programs play a significant role in informing citizens and combating misinformation. A clear example of this is the FATOS2U project, which was completed a few months ago. The following section presents the project's content and outlines its main outcomes.

### **The EU-funded project FATOS2U**

FATOS2U -Media Education and News Literacy to yoUth against Fake news reception and implicatiOnS- is an Erasmus+ KA2 project approved by the Portuguese National Agency with an implementation period of 24 months, between 01/05/2022 - 31/10/2024 (<https://fatos2uproject.eu/>). The project was carried out by a consortium of 5 organizations: ASDPESO, MVNGO, XENIOSPOLIS, GRIPEN EUROPE, NGO Nest Berlin from 5 European countries Portugal, Italy, Greece, Greece, Romania and Germany

FATOS2U promoted critical thinking and literacy in Media and news among young people, with the aim of strengthening democracy and combating manipulation, propaganda and fake news.

The target group of the project included young people aged 18-25 years old, youth leaders and trainers active in relevant training programs, as well as other stakeholders such as representatives of NGOs and civil society organizations, media literacy experts, staff of public services and members of youth councils.

The objectives of the project focused on supporting young people to be able to critically and ethically manage the information they receive from the media and make more informed decisions. At the same time, the project sought to raise awareness about fake news and misinformation, to strengthen critical thinking about media content, and to provide

## **PROCEEDINGS**

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

educational tools to combat these phenomena. Finally, it also aimed to identify the role and responsibilities of young people in navigating the digital environment.

The project produced three project results (PR) which are presented below.

### **PR1: Curriculum & Learning Materials Toolkit**

Research and benchmarking was conducted on a) youth perceptions, attitudes and concerns about fake news and misinformation, interaction rates, level of engagement, etc., b) any youth training models for developing skills and knowledge related to identifying/challenging misinformation, and training schemes across partner countries. Partners collected data from various sources (literature review, focus groups, questionnaires among target group members and data analysis). The data provided the partnership with essential context and parameters on the design and implementation steps.

The FATOS2U curriculum was then developed which includes 5 modules. Each partner developed one module each. These are the following: MODULE 1 - Media Literacy and Awareness for key principles as vital tools to address the spread of fake news online. MODULE 2 - Disinformation, Fakes News, and Propaganda as means of manipulation and threats to democracy. MODULE 3 - Youth as the most vulnerable group to Fake News and disinformation. MODULE 4 - Fake News / Disinformation & Societal Crisis (e.g. COVID healthcare crisis, migration). MODULE 5 – Fake News / Disinformation, Politics in European context & International Tension. More information about the PR can be found on the following website: <https://fatos2uproject.eu/pr1-fatos2u-curriculum-and-learning-materials-toolkit/>.

### **PR2: Multifunctional Digital Resources**

#### **FATOS2U Multifunctional and Interactive Platform**

The first part includes the multifunctional and interactive educational platform, which integrates all the educational material. The educational material is available in all the partnership languages: Portuguese, Greek, Romanian, Italian, German, and English, ensuring broad accessibility and understanding for all participants. The educational platform can be found at the following link: <https://fatos2uproject.eu/fatos2u-modules/>.

#### **FATOS2U Mobile Application (Android, iOS)**

As part of the project's digital tools, the FATOS2U mobile application was developed for Android and iOS platforms. This app was designed to enhance the users' educational experience by offering easy and immediate access to the project's educational content and interactive tools. The application can be downloaded via the website <https://fatos2uproject.eu/>.

## PROCEEDINGS

---

### PR3: Training Guidelines Handbook

The FATOS2U Training Guidelines Handbook provides clear instructions to organizations, youth leaders, and educators on how to use the FATOS2U online platform in their daily educational activities.

It includes guidance on:

- Integrating the platform into youth education
- Coaching techniques and differentiated instruction
- Methods for educating young people aged 18–25 to make informed decisions in today’s media environment

The goal is to help young people develop analytical and critical thinking skills to identify fake news, respond appropriately, and adopt an ethical approach to consuming information—thereby protecting democracy and its values.

As part of PR3, model scenarios were developed for identifying fake news (message – sender – receiver, language, semantics) in specific contexts (e.g., COVID-19 information and updates, migrants in society, etc.), including steps such as recognition, rejection/reflection, and feedback.

Based on the module they had already created, partners were invited to develop their own short model scenario. These scenarios serve as teaching proposals for youth trainers, enabling them to teach parts of each module’s content in a more effective and engaging way. More information about PR3 in all consortium languages from the link below: <https://fatos2uproject.eu/pr3-training-guidelines-handbook/>.

On the occasion of FATOS2U, we conducted our research to explore the link between literacy, disinformation and health in relation to sustainability and the digital environment. We conducted research on EU-funded projects on literacy, misinformation and health, with a focus on sustainability and the digital environment. Data from ERASMUS+ and CORDIS EU RESULTS databases were analyzed, exploring the link between these topics and health.

### Methodology

#### Research in the ERASMUS+ PROJEC and CORDIS EU RESULTS databases

More specifically the research was conducted in the early days of 2025 in the databases of European Union-funded programs. The research followed two directions. At the first level, the ERASMUS+ PROJECTS<sup>9</sup> database was studied. These are programs with small to medium funding, focused on education, training, youth, and sports. At the second level, the CORDIS EU RESULTS<sup>10</sup> database was explored, which mainly concerns large-scale funding programs and the development of transnational research and cooperation, such as HORIZON, ERC, and others. In both cases, the research focused on the connection between literacy, misinformation, and health in relation to sustainability and the digital environment.

---

<sup>9</sup> ERASMUS+ PROJECT RESULTS <https://ec.europa.eu/programmes/erasmus-plus/projects>

<sup>10</sup> CORDIS EU RESULTS Search | CORDIS | European Commission (europa.eu)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

In the ERASMUS+ database, two keyword searches were conducted. The first combined the terms “literacy”, “misinformation”, and “health”, while the second used “sustainable”, “digital”, “disinformation”, and “health”. In the CORDIS EU Results database, a single search was performed using the keywords “sustainable”, “digital”, “disinformation”, and “health”.

The results of this investigation are discussed in the following section.

### Results

For ERASMUS+ programs, the search was carried out by keywords on the total number of funded programmes (274,090 programmes). Searching for the combination of the words “literacy”, “misinformation”, “health”, 69 programs were found, as illustrated in **Figure 1**. All were conducted in the last 7 years (2017-2024).

---

Searching for another combination of the words "sustainable", "digital", "disinformation", "health", 35 cases of funded projects appeared. In this case all were conducted in the last four years (2020-2024), as illustrated in **Figure 2**.

**Figure 2. Map of 35 European funded projects regarding “Sustainable, digital, disinformation, health” (2020-2024)<sup>11</sup>**

Annex 2. [ErasmusPlus Projects Search Results \(35\).xlsx](#)

More specifically, of the funded programs that appeared in the search with the combination of the words "sustainable", "digital", "disinformation", "health", these concern the mobility programs KA1: Learning Mobility of Individuals (27 in total) and KA2: Partnerships for cooperation and exchanges of practices (8 in total).

The funded programs span a wide array of thematic areas, reflecting both recurring priorities and more specialized or emerging topics. The most prominent themes include media literacy and tackling disinformation, as well as digital skills and competences, which collectively account for a significant share of the projects. Other frequently addressed areas include European identity, youth inclusion, well-being, and the use of digital technology. A number of projects also focus on democratic participation, refugee integration, equality, and

---

<sup>11</sup> Although the map shows 4 coordinated projects for Portugal, the accurate number is 5, as confirmed by paper records (Annex 2) and presented in Table 2. The discrepancy is attributed to a visualization error.

| Digital youth work                                                           | 2                        |
| Creativity, arts and culture                                                 | 2                        |
| Inclusion, promoting equality and non-discrimination                         | 2                        |
| Digital safety                                                               | 2                        |
| Environment and climate change                                               | 1                        |
| Health and wellbeing                                                         | 1                        |
| Key Competences (incl. mathematics and literacy) – basic skills              | 1                        |
| New innovative curricula/educational methods/development of training courses | 1                        |
| Youth (Participation, Youth Work, Youth Policy                               | 1                        |
| Entrepreneurial learning – entrepreneurship education                        | 1                        |
| Migrants’ issues                                                             | 1                        |
| Key competences development                                                  | 1                        |
| Preventing racism and discrimination                                         | 1                        |
| Reception and integration of refugees and migrants                           | 1                        |
| Information and communication technologies (ICT)                             | 1                        |
| Green transport and mobility                                                 | 1                        |
| Tackling geographical remoteness and involving rural areas                   | 1                        |
| Activeageing                                                                 | 1                        |

It is observed that the majority of the projects concern media literacy and tackling disinformation, digital skills and competencies, as well as European identity and values.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Finally, the research identified these programs as being developed within the following categories: Youth (26 projects), School Education (4 projects), Adult Education (3 projects), Vocational Education and Training (2 projects), Higher Education (0 projects).

It is noteworthy that there is a lack of development of relevant programs in higher education, as well as a limited presence in vocational and primary/secondary education, in contrast to their significant growth in the field of youth.

The coordination of 35 projects was distributed across multiple countries, with the highest number attributed to Portugal. Further details on the distribution can be found in **Table 2**.

**Table 2. Distribution of Coordinated Projects by Country**

| Country     |                            | Number of Projects |
|-------------|----------------------------|--------------------|
| Portugal    | EU Member                  | 5                  |
| France      | EU Member                  | 3                  |
| Ireland     | EU Member                  | 3                  |
| Bulgaria    | EU Member                  | 2                  |
| Germany     | EU Member                  | 2                  |
| Denmark     | EU Member                  | 2                  |
| Greece      | EU Member                  | 2                  |
| Spain       | EU Member                  | 2                  |
| Italy       | EU Member                  | 2                  |
| Netherlands | EU Member                  | 2                  |
| Poland      | EU Member                  | 2                  |
| Austria     | EU Member                  | 2                  |
| Cyprus      | EU Member                  | 1                  |
| Estonia     | EU Member                  | 1                  |
| Hungary     | EU Member                  | 1                  |
| Lithuania   | EU Member                  | 1                  |
| Slovakia    | EU Member                  | 1                  |
| Turkey      | Third Countries associated | 2                  |

In the CORDIS EU RESULTS database, the search was also conducted using keywords across all funded programs. A total of 9 results were found based on the search terms “sustainable”, “digital”, “disinformation”, and “health”. Most of these projects were carried out in the last decade (2016–2024). An overview of the results by funding programme is presented in **Table 3**.

**Table 3. Number of Relevant Projects Found per EU Framework Programme**

| Framework Programme         | Number of projects |
|-----------------------------|--------------------|
| Horizon Europe 2021-2027    | 1                  |
| Horizon 2020                | 8                  |
| Framework Programme 7 (FP7) | 0                  |

All eight projects presented in Figure 3 were **coordinated by organizations based in the respective countries**, within the Horizon 2020 framework. The distribution spans several European countries and years, as follows: Greece (2018–2021), Belgium (2020–2023), Sweden (2018–2021), Italy (2020–2024 and 2021–2024), Finland (2019–2022), Estonia (2016–2019), and Germany (2020–2024).

In contrast to the eight projects identified under Horizon 2020 (**Figure 3**), only one project matching the same criteria was found under Horizon Europe, coordinated by Slovakia (2022–2025) (**Figure 4**).

**Figure 3. Map of 8 European funded projects regarding “Sustainable digital disinformation health” (Horizon 2020)**

**Table 4. Coordinated Projects Under Horizon 2020 And Horizon Europe**

| Framework Program        | Country  | Implementation period |
|--------------------------|----------|-----------------------|
| Horizon Europe 2021-2027 | Slovakia | 2022-2025             |
| Horizon 2020             | Greece   | 2018-2021             |
| Horizon 2020             | Belgium  | 2020-2023             |
| Horizon 2020             | Sweden   | 2018-2021             |
| Horizon 2020             | Italy    | 2020-2024             |
| Horizon 2020             | Italy    | 2021-2024             |
| Horizon 2020             | Finland  | 2019-2022             |
| Horizon 2020             | Estonia  | 2016-2019             |
| Horizon 2020             | Germany  | 2020-2024             |

**Table 4** presents the projects identified under the Horizon 2020 and Horizon Europe (2021–2027) frameworks, in which the listed countries acted as project coordinators. The projects focus on themes related to “sustainable digital disinformation health”, and their implementation periods range from 2016 to 2025. The analysis of the data reveals that issues related to sustainability, digital transformation, misinformation, and health remain at the forefront of research and continue to receive funding under the new framework program, Horizon Europe.

### Conclusions

This paper highlighted the importance of digital literacy and the ability to recognize misinformation as critical tools for protecting public health. The spread of false or misleading information, especially on health-related issues, poses a serious threat to social cohesion and individual well-being. The need for informed and critically thinking citizens is becoming increasingly urgent, as the flow of information on the internet is often accompanied by inaccuracies or ulterior motives.

The European Union actively supports health improvement through policies and financial assistance, but it does not replace the role of individual states, each country remains responsible for its own healthcare system.

The FATOS2U program stands out as a prime example of a successful non-formal educational initiative aimed at empowering young people. Through innovative tools and multilingual educational materials, it supports the development of skills that enable participants to recognize fake news, identify reliable sources, and actively engage in public discourse with responsibility and critical thinking.

The research conducted in the ERASMUS+ and CORDIS databases revealed a significant number of projects linking digital literacy with health and misinformation. However, limited activity was observed in higher education and large-scale research programs, indicating the need for further investment and strategic focus in these areas.

In this context, it is worth noting that the limited presence of relevant projects under the Horizon Europe program (2021–2027), compared to the strong activity observed during Horizon 2020, highlights the need for further investment and support for research initiatives focused on sustainability, digital transformation, misinformation, and health. Today’s pressing challenges—such as managing digital information, promoting sustainability, and strengthening public health through innovative solutions—demand transnational approaches. The European Union has the opportunity to bridge existing gaps by encouraging greater collaboration, broader geographic participation, and new research initiatives that harness the power of digital technologies to build sustainable and resilient societies.

# CULTURAL TOURISM AND LOCAL SUSTAINABLE DEVELOPMENT: THE CASE OF THE DIGITAL GAMES IN THE MUSEUMS

**Bokolas Vassilis**

*Coordinator, Scientific director of XENIOS POLIS, Neapolis University Paphos*  
[vbokolas@xeniospolis.gr](mailto:vbokolas@xeniospolis.gr)

**Skyrianou Martha**

*Cultural Heritage Researcher & Consultant in Region Skånes Kulturförvaltning,  
MA Sustainable Heritage Management, Aarhus University*  
[marthaskyr@hotmail.com](mailto:marthaskyr@hotmail.com)

## Abstract

Cultural tourism, as one of the fastest growing sectors of the tourism industry, plays a key role in promoting sustainable development by strengthening the economy while contributing to the preservation and enhancement of cultural heritage. At the local level, cultural tourism contributes to the economic vitality of communities and the various social, age and professional groups, but also strengthens their cohesion and their members' identity. It also serves as an empowerment tool, enabling local populations to actively participate in the management of their cultural heritage and to benefit from it. In this context, museums - as a key pillar of cultural development and tourist attraction - are re-shaping their strategy and digitally transforming their services. In fact, museums are exploring dynamic ways to connect the general public with cultural heritage, using technology to create interactive experiences that promote immersive storytelling and expand accessibility. Therefore, as museums invest in attracting and engaging the public, they cannot screen out the commercial development, social acceptance and mass use of the digital games sector. This study demonstrates the introduction of digital games in museums over the last decades and explores their role. According to cutting-edge research, digital games potentially promote cultural heritage, raise awareness of their importance and encourage users to visit museums (more often). In addition, the use of this medium motivates population groups (e.g. the so-called digital natives/users) to (re)connect with museum sites and cultural events. In recent years, the use of augmented, and virtual reality (VR) games in museums and exhibitions has significantly increased. In particular, 'serious games' appear to have a variety of educational benefits in heritage environments. Last, apart from being a tool for highlighting the exhibits and involving the public in cultural activities, digital games are also included as a complementary or as basic museum exhibition objects.

**Key words:** cultural tourism, sustainable development, cultural heritage, digital games, museums

### CHALLENGES OF INTERNATIONALIZATION PROCESS OF UNIVERSITIES IN ALBANIA

**Skendaj Elton**

*PhD C, Mediterranean University of Albania*

[elton.skendaj@umsh.edu.al](mailto:elton.skendaj@umsh.edu.al)

#### **Abstract**

Internationalization in the higher education institutions in Albania has been for some time the center of discussions and initiatives from the main education authorities and HEIs themselves. Internationalization also comes as an imperative from the law “On Higher Education in the Republic of Albania 80/2015” right from the start, Chapter I, Article 1, paragraph e) states: Higher Education is a public responsibility and service whose mission is to support international cooperation in the field of higher education.

Following the fall of the communist regime in the early 90s, the entire landscape of higher education started to change. New universities were formed and they were faced with the immense task of applying standards required. While in 2007, Albanian universities became part of the Bologna Process. One of the challenges they were faced with was the internationalization. Lack of experience and many other elements are the key factors why universities are struggling regarding internationalization.

Despite some efforts undertaken to cooperate with universities abroad, the real sense of internationalization came through the Erasmus+ program back in 2014. Universities in Albania were part of the exchange programs but with limited numbers in the beginning and with an outgoing tendency while the numbers of incoming students remain low due to lack of programs in English.

**Keywords:** internationalization, law, higher education institution, Erasmus+, students, programs

#### **Abstract**

In contemporary juncture digital games prove themselves as a versatile developing field with a variety of dimensions and applications. More specifically, however, the teaching and learning that focus on digital games seem to cultivate the ability to represent the real world while it contributes into the development of mental abilities and contemporary digital skills as well, something that is a priority of the European Union politics. Actually, digital games gain ground more and more every day as differentiated teaching implements, too, while initiatives and good practices for the support of children who face specific learning difficulties develop progressively.

The objective of the present study is double. In the first instance, the role of digital games into the development of communicative and learning skills of children with learning difficulties {dyslexia, dyscalculia, misspelling, attention deficit hyperactivity disorder (ADHD) etc.} is examined. Based on the review of contemporary international bibliography, it is deduced that the ability to personalize, the interactivity and the attractive nature of digital games have a positive effect both on children's frame of mind and social behavior and on their cognitive empowering as well.

In the second instance good practices are studied which show that digital games succeed learning through multiple channels, enforcing remarkably phonological awareness, reading and writing skills, understanding mathematical concepts and emotion recognition too, in children with dyslexia, autism or attention deficit hyperactivity disorder (ADHD). At the same time, the use of digital tools that incorporate playful techniques instigate significant improvement in measures of attention performance as well as in the improvement of self-organization and self-regulation in students with ADHD and specific learning difficulties.

Finally, gamification and serious games approaches also appear to lead to improved motivation, engagement and self-confidence in children with dyslexia. On the one hand this study opens a dialogue on the dynamics of digital games in supporting children with learning disabilities and on the other hand on the optimization of existing or the creation of new applications in the context of interdisciplinary collaborations.

**Key words:** digital games, learning difficulties, skills, good practices

# DIGITAL ENTREPRENEURSHIP AND SUSTAINABLE DEVELOPMENT: THE DISTANCE LEARNING OF GREEK AS A FOREIGN LANGUAGE EXAMPLE

**Karageorgou Irene**

*Philologist/ entrepreneur*

[karageorgou.eirini@gmail.com](mailto:karageorgou.eirini@gmail.com)

## Abstract

At a time of multicultural and multilingual societies and constant digital transformation, a nation's language is not only a major cultural element, but also a communication tool as well as a necessary condition for personal and professional advancement. The subject of this paper is the study of synchronous and asynchronous distance learning of Greek as a foreign language and its contribution to the digital sustainability of business and related activities.

The interactive educational platform Greek Talk is presented in the study. The project was developed in accordance with the European models of communication and digital skills development and offers lessons in Greek as a foreign language in a modern, digital educational environment. The content is based on original speech and the principles of personalization and personal freedom. At the same time, pedagogical purposes are connected with Modern Greek culture thus motivating active learning while becoming the foundation of cultural awareness.

The study aims to explore teaching foreign languages with the use of digital tools as a business venture and its efficacy within a constructive learning frame. The structural parts of Greek Talk, along with the supportive digital media, the digital books and the teaching activities in use, the accomplished results and the data outline the users' profiles. Finally, the business development potential of the certain field as well as the application, are discussed.

**Key words:** Greek language, distant education, digital media, sustainable business development

## Abstract

Traditionally, heritage has been viewed as a “passive victim” of rapid urbanization, facing threats to its survival rather than being recognized for its potential to actively contribute to the sustainable development of cities. But it is a fact that cities could benefit from the protection of its heritage. It is well known that conserving historic buildings provides significant economic, cultural and social benefits.

Within this context, it is necessary to redefine how cultural heritage nowadays is understood and which role could play for the city’s resilience. In the ever-evolving landscape of urban development, the preservation of architectural and industrial heritage stands as a testament to collective history and identity.

So, in this framework, and by having in mind from one hand that “heritage is dynamic, as it links the past, the present and the future” and from the other hand that heritage protects and enhances collective historical memory, this presentation concerns on two recent research programs on the regeneration, revitalization and integration of architectural heritage of tobacco warehouses in contemporary urban environment of three different cities of northern Greece: Drama, Kavala and Xanthi.

By analyzing two tobacco warehouses as case studies, the aim was to include all the necessary stages - from documentation to restoration good practices - in order for the buildings to be integrated into the urban fabric, as well as the whole socioeconomical city network for its urban resilience. Focusing on the adaptive reuse of tobacco warehouses in these Greek cities, the paper explores strategies that not only safeguard the cultural significance of these structures but also contribute to sustainable urban futures.

Through an in-depth analysis of two tobacco warehouse case studies, the research aims to encompass all crucial stages from documentation to the implementation of effective restoration practices. These efforts seek to ensure that these significant structures are seamlessly woven into the urban fabric and contribute meaningfully to the socio-economic vitality of their respective cities.

**Key words:** cultural heritage, urban resilience, tobacco warehouses, historical urban landscape

## **Abstract**

The dominant objective of a modern state is the achievement of development in the three productive sectors of the Gross Domestic Product: primary (production of raw materials), secondary (processing of raw materials) and tertiary (providing services). Basic parameters of development are social processes and practices, interpersonal communication, economic, political and cultural partnerships, as well as active strategic management policies. Development is a “whole” that requires “total quality management” in order to be properly managed, protected and promoted. The management of cultural heritage and cultural tourism must take into account and pursue “sustainable development”, which meets the needs of the present, without compromising the ability of future generations to meet their own needs. Appropriate, feasible and effective cultural management promotes economic, social, cultural and environmental sustainability in a national and local context. The Old Municipal Hospital in the Upper Town area of Patras (Old Patras) is a tangible example of the utilization and promotion of the local cultural capital through the process of its reuse and return to society. Being characterized as a “newer monument” by the Ministry of Culture, it receives permanent protection and cultural exploitation.

**Keywords:** development, sustainability, historical memory, place-landscape, Upper Town area of Patras, Old Municipal Hospital.

## **Introduction**

The paper focuses on the concept and importance of cultural heritage and sustainable urban development as pillars of an effective cultural policy. It also examines the role of local organizations with cultural action, which -through their principles, objectives, policies and actions- save and promote cultural heritage, but also design urban sustainability programs. The case study investigates the historical physiognomy, use, management and development perspective of the Old Municipal Hospital of Patras as a monument-landmark of the Upper Town area of Patras in relation to the sustainable development and promotion of the historical urban area in question.

### **Definition and characteristics of “development”, “sustainability” and “landscape”**

The main objective of a modern state is to achieve development in the three productive sectors of the Gross Domestic Product: primary (production of raw materials), secondary (processing of raw materials) and tertiary (provision of services). “Development” is defined as a better balance of social and human relations and systems of land use, production, employment, distribution and consumption, in accordance with the values and choices of the forces in power, as they militantly coexist and interact in the natural environment, with the specific social dynamics and the average social consciousness (Πόκος 2001). One understands that development parameters are created by social processes and practices, interpersonal communication, economic, political and cultural partnerships, as well as active strategic management policies. Development is a “whole” that requires “total quality management” in order to be properly managed, protected and promoted. “Total quality management” is defined as the modern management philosophy for improving the quality and effectiveness of organizations by systematically considering planning, administration, organization, strategy, interaction and evaluation at each stage of development of goods (products and services) (Δερβιτσιώτη 1993).

The management of cultural heritage and cultural tourism must seek “sustainable development”, while it can also be rendered as “supportable development” (Ανδριώτης 2008, 38). According to the World Commission on Environment and Development (WCED) (1987, 43) “sustainable development is that which meets the needs of the present without compromising the ability of future generations to meet their own needs. It is a process of transformation, where the exploitation of wealth-producing resources, the direction of investments, the orientation of technological development and the adjustments to the institutional framework are harmonized and elevate the current and future possibilities, in order to satisfy human needs and aspirations”.

The European Union of Historic Cities and Regions is also based on the previous definition of sustainable development through the “Guidelines for Sustainable Cultural Tourism in Historic Towns and Regions” (European Association of Historic Towns and Cities 2009, 1). The Association highlights the need for cultural tourism to respect cultural and natural heritage, to promote cultural exchanges between people, to inspire intercultural dialogue and to create spatial investments and jobs for all productive social groups. Additionally, it is recognized that the essence of the concept of “sustainability” must take into account the following factors: a. Visitors (the satisfaction of their needs, expectations and in general their quality stay in the reception areas), b. Businesses (the safeguarding of the need for small, medium and large tourism businesses to be profitable and long-lasting by offering authentic experiences to their visitors), c. Local Communities (the respect for their values, needs and overall quality of life, so that local identities are maintained and authentic local cultural assets are protected), d. Environment (the effort to protect and preserve the cultural and natural environment, local peculiarities and the image-feeling of each place-landscape). In fact, in the new “Guidelines for Sustainable Cultural Tourism”, in addition to the concept of “sustainability”, the concept of “resilience” has also been provided for, which is defined as “the ability of cultural tourism to recover from situations of challenges and crises”, such as the Covid-19 pandemic (European Association of Historic Towns and Regions 2009, 9• <http://www.historic-towns.org/wp-content/uploads/2020/07/Guidelines-for-Sustainable-Cultural-Tourism-2020-1.pdf>).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

In the Greek legislative framework, Law 4447/2016 (Chapter A, Article 1) defines the concept and characteristics of “sustainable development” as follows: “sustainable development is development that combines social, economic and environmental objectives with the aim of: a. achieving sustainable economic growth by creating a strong productive base and emphasizing innovation and increasing employment, b. territorial and social cohesion, fair distribution of resources and lifting exclusions, c. protection of the natural and cultural environment, biodiversity, landscape and the sustainable use of natural resources”. Regarding the first pillar, economic sustainability, it is envisaged to spread the economic positive effects to all productive classes, to strengthen economic stability and to upgrade the role of the “creative economy” through the efficiency of economic figures and changes in the way of thinking and acting for the benefit of the quality of life (Florida 2008).

The modern concept of sustainable development could become “integrated” with: a. understanding the dynamic and indivisible wholeness of nature, society and culture, b. interpreting and evaluating development as quality of life within the structured and unstructured environment, in which man actively participates as a subject and accepts the results of his interventions as an object of development. “Empathy” as self-awareness and other-awareness, as well as the collective production process, create economic, technological, social, cultural and environmental progress. The culmination of the concept, essence, characteristics, principles, goals and implementation practices of “sustainable development”, as well as a model for establishing sustainability rules, is the United Nations, which in 2015 adopted the “2030 Agenda for Sustainable Development” with the establishment of 17 ambitious global goals. UNESCO also played an active role in this event, determining that sustainable development is not understood if it is not implemented by people for people. The 17 goals include the following (UN 2015, 14):

1. Eradicate poverty
2. Eradicate hunger
3. Ensure good health and well-being
4. Ensure quality education
5. Achieve gender equality
6. Ensure clean water and sanitation
7. Ensure affordable and clean energy
8. Ensure decent work and economic growth
9. Ensure innovation and industrial infrastructure
10. Achieve social inclusion
11. Ensure sustainable cities and communities
12. Ensure responsible consumption and production
13. Achieve climate action
14. Achieve life below sea
15. Achieve life on land
16. Achieve peace, justice and strong institutions
17. Achieve partnerships for the goals.

Specifically for “Culture”, UNESCO confirms that its role will be recognized in most of the above goals, extending from cultural heritage to contemporary culture and cultural and creative industries. Culture is the animating and guiding factor of the economic, social and

---

environmental dimensions of sustainable development. Goal No. 11 places the cultural dimension of sustainability within urban development by protecting and promoting urban cultural heritage worldwide. In cities local identities of diverse communities of people are developed and organized, which need to be preserved and promoted, because they promote cultural diversity and intercultural approach through intercultural dialogue. The “city” is a historical, cultural, natural creation, that is, a creation of the partnership of art and nature. The respective strategic and operational development and promotion planning differentiates its image in the globalized “becoming” and generates a competitive advantage over other cities. This national planning must take into account the concept, essence and policy of “landscape”, as it plays an important role of public interest from an economic, social, cultural, ecological and environmental perspective and whose protection and management require special care, contributing to the creation of jobs and promoting creativity and innovation. One understands, therefore, that a simple geographically defined place or space, natural or urban, unstructured or structured, becomes a “landscape” when “it is shaped in such a way that building structures and natural elements are combined in order to cover in a complex way all social requirements” (Μωραΐτης 2016, 30). Therefore, the landscape is characterized by functional and aesthetic harmony, by cultural, historical and natural demarcation, as well as by the development of economic and social activities. Thus, the simple place-space as a geographical dimension or physical surface is organized into an intentional multidisciplinary unity in structure and content, acquiring “cognitive, material and emotional contexts [...], which are susceptible to transformation and change” (Tilley 1994, στοΓιαλούρη (επιμ.) 2017, 219). According to this approach, the urban place, the city and urban areas should be considered as the “place of place(s)”, as multifunctional human activity develops and is organized in them (Μωραΐτης 2016, 38).

The term “landscape” and its perception composes a meaning-giving system, which is related to statements and connotations, literal and symbolic elements, which generate ideology, identity, culture and coexist within the image of a city or urban area. According to Τερκενλή (1996, 18) “all landscapes are symbolic, that is, expressions of cultural values, social behavior and personal individual action in certain spatial locations, over a period of time. Therefore, cultural landscapes can be considered as repositories/reservoirs of meanings and concepts, originating from the social groups that currently occupy them or occupied them in the past”. They are directly or indirectly linked to the process of memory both at the level of recalling memories of the past and at the level of their practical, functional and symbolic utilization in the environment of the present. In this way, every landscape -natural or anthropogenic, structured or unstructured, referential or symbolic- creates in collective memory the bases for the genesis of identities. The symbiotic societies of every era, whether natural or conventional, were defined racially, linguistically, religiously, culturally, and guild-wise by the characteristics of the place and landscape in which they were part of, which is why they differentiated “us” from “the others”. The determination of local or national identity with its above-mentioned sub-definitions requires the process of memory and, at the same time, its interpretation. The past is transformed into an experience when it is inscribed in the cognitive and interpretive background of the community within a certain and fully understood place-landscape. This view carries the risk of a local-regional determinism, as in the past space and landscape were considered axes of pure racial identity and in complete

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

opposition to the identity of the “other”. Today, however, “[...] the view that considers culture as a means of adapting man to nature in the general context of questioning the “man-nature” dichotomy has been overcome and a holistic approach is being promoted, where culture and environment are treated as parts of a continuum, as inseparable elements of a single process. [...]. These new identities are in no way understood as homogeneous and static, nor as “rooted” in a place, as national ideology wants them to be and as social sciences largely treated them until recently.” (Νιτσιάκος 2003, 28, 97-98). The phenomenon of urbanism-urbanization at the state level and the phenomenon of globalization-transnationality at the transnational level contributed to the relaxation of the strict interconnection of the place-landscape with the pure local or national identity of its inhabitants. Thus, today, we are in a position to say that as a global society we have largely overcome an autopathic, isolating and self-oriented framework, towards a heteropathic-allopathic, socio-universal framework, oriented towards the “other” and the world. The interaction of communities through the contribution of inherent identity elements ensures the continuity and democracy of the landscape. Therefore, according to the anthropologist Geertz (2003, 347-348), “the progress towards humanity -that gradual development of higher intellectual capacities, which Rousseau called “perfectibilité”- was destroyed by cultural provincialism, armed with an immature science. Cultural universalism, armed with a mature science, will set it in motion again”.

The United Nations’ “New Urban Agenda” (2017) envisages the integration of the 17 sustainability goals in the field of cities and urban development policy. Cities today, although they geographically constitute only 2% of the world’s land area, contribute 70% to the Gross Domestic Product, 60% to global energy consumption, 70% to greenhouse gas emissions and 70% to global waste (<https://habitat3.org/the-new-urban-agenda/>). From the above data it is clear that modern cities, with the activities they develop and their spatial planning, must serve development prospects, with the aim of their local, national and international visibility. This is why the collaboration of many “interest groups” (“stakeholders”) involved in urban upgrading, such as public and private services, special scientific groups and local communities, is required, in order to give a special “local color” and to ensure a competitive advantage in the international cultural and tourist scene. A tangible example of creative policy within an urban landscape is the planning of a multifaceted reopening and reuse of the Old Municipal Hospital of Patras.

### **Old Municipal Hospital of Patras**

#### ***A. Historical context***

It was built in 1857 constituting a remarkable and representative example of neoclassical architecture and a historical urban landmark for both the Upper Town area of Patras and the entire city of Patras. The neoclassical building by the Danish architect Hans Christian Hansen operated as a hospital for 101 years, from 1872 to 1973, while today it is considered a cultural center of the city (<https://www.e-patras.gr/el/axiotheata>). On October 15, 1857, the foundation stone of the building was laid by King Otto in the presence of his wife, Queen Amalia.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The surface area of the site is 3,650m<sup>2</sup>. The plan was drawn up by the Danish architect Hansen. Construction began immediately under mayor Venizelos Roufos and ended in 1871 under mayor Georgios Roufos. Its administrators in turn (and until the beginning of the 20th century) were: I. Giannopoulos, Th. Efstathopoulos, K. Papastathopoulos, H. Koryllos. The latter, taking over the administration in 1890, excavated the basement of the building and installed the pharmacy, outpatient clinics, kitchens and warehouses there. During the Balkan Wars and World War I, the hospital treated soldiers, while during World War II it was occupied by the Italians and the Germans (Τριανταφύλλου 1980, 269). During the first decades of its operation it had a surgical, pathological, obstetric and radiological department, while it had a microbiological laboratory and an autopsy room. Within the premises a church of St. Charalambos was built in 1914, on whose image many vows were hung. Until 1958 it operated under the supervision of the Municipality, when it was nationalized. It is the third oldest hospital in Greece after those of Nafplio and Athens.

The monumental identity of the declared modern monument of the Old Municipal Hospital of Patras, according to the Ministry of Culture, is the following ([http://listedmonuments.culture.gr/monument\\_print.php?code=2545](http://listedmonuments.culture.gr/monument_print.php?code=2545) • [https://www.arxaiologikoktimatologio.gov.gr/el/monuments\\_info?id=157636&type=Monument](https://www.arxaiologikoktimatologio.gov.gr/el/monuments_info?id=157636&type=Monument):

### ***B. Development and sustainable perspective interventions***

It consists of building complexes, which have been constructed in six different time periods from 1871 to 1934. The actions and projects concern the exploitation of the cultural heritage through the use of new technologies and the development of a digital strategy for the tourist promotion and promotion of Patras. Through reuse the space will be able to function as a lever for the development of the region at the historical, social, cultural, educational and economic levels, but also contribute to the development of thematic tourism. The core of the actions includes the creation of a permanent structure for the collection, preservation, study, documentation, digitization, projection and promotion of the Audiovisual Heritage of the city and the wider region of Achaia, in order to promote the preservation of the memory of the cultural evolution of the region (ΔήμοςΠατρέων 2016, 178-180). The new zoning of the building's functions provides for the following uses (ΔήμοςΠατρέων 2017<sup>a</sup>, 1-2• ΔήμοςΠατρέων 2017<sup>b</sup>):

- ✓ the ground floor western part of the Hansen wing remains as a space for periodic exhibitions and activities,
- ✓ in the corresponding underground western part of the same wing, instead of the Medical Museum, artistic creation workshops and offices are located,
- ✓ the eastern underground and ground floor part of the Hansen wing and the eastern and northern wings of the complex are transformed into a Digital Audiovisual Heritage Center of the city,
- ✓ in the northwestern wing the dining area remains and is expanded into the elevated two-story building of the western wing with the function of a café-restaurant,
- ✓ the ground floor hall of the western wing is formed into a small conference center with multiple uses combined with the other spaces,
- ✓ auxiliary spaces, administrative offices and other supporting functions are provided in the remaining spaces of the building complex.

More specifically, the Digital Audiovisual Heritage Center will focus on aspects of the cultural evolution and history of the city and the wider region, as they have been captured in various forms and various material carriers of audiovisual records, namely moving images, photography and sound recordings. It will have the following structures organized in the respective spaces, as reflected in the architectural plans (ΔήμοςΠατρέων 2016, 180-18• ΔήμοςΠατρέων 2017<sup>a</sup>, 3-4):

- a) Exhibition Space: a versatile exhibition space with the greatest possible flexibility in terms of its conversion possibilities depending on the needs of each exhibition.
- b) Archive Space: a repository of the city's memory with conservation laboratories and storage areas for documents under the appropriate conditions.
- c) Digitization Space: digitization of the center's collections and any other archival documents with which they will be enriched, in accordance with technological standards and best international practices.
- d) Research and Documentation Area: organization, maintenance, classification of materials that have already been recorded, as well as detection of any relevant material that is missing from the research. The area will function as a hub for attracting and gathering archival documents. Furthermore, as an autonomous research unit, it will be

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

able to gradually expand its activities to the primary creation of audiovisual documents, which will contribute to the recording of the history and development of the city and the wider region.

- e) Study Area: in this, researchers, students, pupils, citizens and any other interested party will be able to have open access to all the documents. The possible interconnection of the relevant computer systems with the data of the Municipal Library of Patras and the Library of the University of Patras will offer multiplier benefits.

The indicative budget for the project and the individual actions amounts to €5,000,000, while the target groups benefiting include 214,000 residents of the city of Patras and 50,000 annual visitors. The Beneficiary and Operating Body is the Municipality of Patras.

Indicative actions and events for the utilization and reuse of the space are the following:

1. During the 2019-2020 school year, the Cultural Organization of the Municipality of Patras, in collaboration with the Department of Secondary Education of Achaia, organized an educational program at the Folk Art Museum for students of Primary and Secondary Education. The Museum was inaugurated on June 20, 2013 and is housed in the Hansen Hall of the Old Municipal Hospital of Patras. The Museum's archival material is composed of various sections, which document a significant part of the cultural heritage of the region with collections relating to:

- ✓ the cultivation of the land and the making of bread,
- ✓ the cultivation of vines, the making of wine and tsipouro,
- ✓ livestock farming,
- ✓ household items,
- ✓ the processing of wool and weaving with a traditional loom,
- ✓ the presentation of material from traditional weaving, printing, hat making, wax making, shoemaking workshops.

According to the educational program the Museum welcomes students every Tuesday and Thursday from October 15, 2019, during the morning hours, with organized tours for groups of students up to 25 people together with accompanying teachers. For the proper planning of the action, an application for participation from each school is attached and telephone contact with the program manager from the Municipality is provided (ΔήμοςΠατρέων 2019• Δ/νσηΔ/θμιαςΕκπ/σηςΑχαΐας2019, 1-2).

2. On August 22, 2021, in the atrium of the Old Municipal Hospital of Patras, the award-winning classical guitarist and composer Panagiotis Margaris presented his new musical performance entitled “Prelude to Love” with pieces-arrangements of wonderful musical compositions by Ennio Morricone, Nino Rota, Mikis Theodorakis, Manos Hadjidakis, Sting, Beatles, Rolling Stones and himself. The performance was part of the events under the title “Full Moon Days”, dedicated to the full moon of August. The “Prelude to Love” marks an artistic mysticism full of notes and tones, a beautiful and timeless journey towards the soul, passion, love, inner turmoil, peace and emotional integration (<https://pelop.gr/patra-meres-panselinou-me-ton-p-margari/>). Admission was free for the public and this proves both the social sensitivity of the Municipality and the need for cultural and spiritual cultivation of the citizens.

3. Within the framework of its responsibilities the Cultural Organization of the Municipality of Patras organizes the “International Patras Festival” every summer with the

## PROCEEDINGS

---

aim of “cultivating the soul and the mind, which gives new impetus and depth to the daily struggle of citizens” ([http://www.patrasculture.gr/?section=1917&language=el\\_GR](http://www.patrasculture.gr/?section=1917&language=el_GR)). The atrium of the Old Municipal Hospital of Patras was used for the performance of the Association - Choir “Anticho” with the title “Three Composers in the Hospital” on September 18 and 19, 2021, at 21:30 ([http://www.patrasculture.gr/managed\\_images/diethens-festival-patras-2021-programma.pdf](http://www.patrasculture.gr/managed_images/diethens-festival-patras-2021-programma.pdf)). The work was inspired by the world of hospitals, which, especially in the era of the pandemic, has highlighted them as places of continuous struggle, where the full range of human emotions unfolds. The texts, that were selected, approached this broad thematic axis in different ways with an emphasis on human pain and healing. Poems by Vizyenos, Souris, Livaditis, Varveris, Kosmopoulos, Brecht, Markopoulos, Karellis, etc. were heard. Special mention was made of the Hospital and its place in the history of the city (<https://gnomip.gr/2021/09/15/treis-sunthetes-sto-nosokomeio/>).

4. Additionally, for the 77th anniversary of the liberation of Patras from the German occupation troops, the Cultural Organization of the Municipality organized the screening of the 2017 documentary film “Hitler vs. Picasso” in the atrium of the Hospital on October 6, 2021, at 20:30. This is a landmark film, as it reveals works of art hidden, looted, condemned by the Nazis, which come to light by projecting on the big screen the Nazi obsession with “degenerate art”, as they characterized it, which was banned, expelled and condemned. The Italian actor Toni Servillo tells the true story of such artistic masterpieces by Picasso, Matisse, Renoir, Chagall, etc.

([https://www.patrasculture.gr/?section=637&page1552=2&language=el\\_GR&itemid1541=4436&detail1541=1](https://www.patrasculture.gr/?section=637&page1552=2&language=el_GR&itemid1541=4436&detail1541=1)).

## Conclusions

The scope and variety of the previous projects and actions demonstrate, on the one hand, the effort of local bodies for holistic cultural management and cultivation, and on the other hand, the need and desire of the people of Patras to get to know the cultural-historical sites and to engage in a fruitful “discussion” with them, creatively experiencing the cultural and artistic events. The financial contribution of both the local community and visitors from neighboring municipalities or other cities is also considered a positive impact, which upgrades the image of the Upper Town area of Patras and contributes to the improvement of its infrastructure. In any case, more fruitful and effective partnerships between local bodies and with the local community are required, an effort to complete the regeneration projects within a specific time frame, but also a more intense communication initiative and promotion through the printed and electronic press at local, regional, national and international level.

### **MATERIAL AND IMMATERIAL CULTURE AND SUSTAINABLE DEVELOPMENT (HISTORIC CITIES, MONUMENTS, CUSTOMS). THE CASE STUDY OF THE MINOR ASIA REFUGEES IN AITOLIA-AKARNANIA, GREECE.**

**Tsoka Evangelia**

*PhD Candidate, Harokopio University of Athens, Greece*

[Ltsoka@hua.gr](mailto:Ltsoka@hua.gr)

#### **Abstract**

Culture, material and immaterial, is one of the main pillars of Urban and Regional Development. The Greeks of Minor Asia had created a high level culture that led to an upgrade of their quality of life. This quality of life was dramatically changed after the Minor Asia Catastrophe in 1922, a fact that forced them to abandon their homeland and find a new place to settle. Almost 9.000 refugees were located to the prefecture of Aitolia and Akarnania. From the moment of their arrival brought with them their dialects, their traditions and their customs, creating a vibrant mosaic of different cultures due to their diverse origin.

The present paper investigates the culture elements that still remain in use by descendants of these people. The establishment of the cultural associations in the 80's proves the will of the maintenance of their ancestors' culture. The research is based on the study of the documents that exist in these associations and furthermore, in the General State Archives of Greece.

The culture wealth of these groups can be leveraged through innovative practices that aim at sustainable development. The promotion of traditional Minor Asia elements such as cuisine, dance and music through festivals, can attract tourists and boost the local economy.

Furthermore, the establishment of museums and culture centers dedicated to the history and the heritage of the Minor Asia refugees, contributes to the educational procedure and encourages the transmission of knowledge from generation to generation.

**Key words:** Material and immaterial culture, sustainable development, Aitolia-Akarnania

### THE UNDERWATER CULTURAL HERITAGE AS MANAGEMENT FACTOR OF THE MEDITERRANEAN LANDSCAPE

**Konaxis Ioannis**

*Asst. Professor, University of Piraeus, Department of Tourism Studies, School of Economics, Business and International Studies*

[ikonaxis@unipi.gr](mailto:ikonaxis@unipi.gr)

#### **Abstract**

The importance of the underwater landscape plays a significant role in the cultural heritage of a region, a fact that was recognized at the international level with the signing of the Convention for the Protection of the Underwater Cultural Heritage in Paris on 2 November 2001 by the General Conference of UNESCO Member States. This international approval was carried out with the prospect of improving the protection measures for the underwater heritage as a reserve of the cultural monumental history of a place. This international agreement is a continuation of the agreement signed on December 10, 1982 by the United Nations Organization on the Law of the Sea and the UNESCO Convention of November 16, 1972 concerning the Protection of the World Cultural and Natural Heritage.

The climate crisis, which has greatly altered the flora and fauna of the Mediterranean underwater areas, as well as the lack of financial resources in order to develop specialized underwater research in the Mediterranean seabed where there are finds of cultural wealth from antiquity, is rapidly making it difficult the correct implementation of the UNESCO agreement and environmental protection.

The UNESCO Convention on the protection and management of the underwater cultural heritage as well as the NATURA2000 network of the European Union which focuses on the protection of fragile marine and underwater areas are international synergies which have the sole purpose of protecting the landscape in environmental, economic and cultural terms level.

This paper highlights the importance of this collaboration of international agreements and emphasizes their interrelated importance with case studies located in the Mediterranean area.

**Key words:** cultural heritage, sustainable tourism, underwater landscape

[agnikaradimou@hotmail.com](mailto:agnikaradimou@hotmail.com)

#### **Abstract**

The World Heritage Monuments (WHM) and sites constitute a special category of monuments. Being selected for inscription on the World Heritage List on the basis of certain criteria, they are considered of outstanding universal value. According to the World Heritage Convention each State Party shall endeavor “to adopt a general policy which aims to give the cultural and natural heritage a function in the life of the community and to integrate the protection of that heritage into comprehensive planning programmes”. In this way, Sustainable Development is introduced as the main axis for the protection and management of WHM, while improving the everyday life of the community is considered as a main goal of the implemented policy.

“Palaeochristian and Byzantine Monuments of Thessalonika”, inscribed on World Heritage List since 1988, is a group of monuments, which includes secular, military and mainly religious ones, an important number of fine churches scattered throughout the historic centre of the modern city. These monuments could be the main touristic attraction for the city, especially in the context of cultural tourism, while they continue to function regularly as places of worship.

The present paper aims to investigate the role of WHM in the economic and social life of the city of Thessaloniki and the degree to which they have contributed in improving the quality of citizens’ everyday life. For this purpose, a survey was conducted with questionnaires which address to certain groups, as well as semi-structured interviews with persons involved in the management of the city’s Unesco monuments. The survey is still in progress. The first results combined with a study of Unesco’s relevant documents as well with onsite investigation show that the impact of the WHM on the city’s life is not analogous to their international status. In this context, some preliminary remarks regarding the current management system are uttered and a proposal for a different approach is made, in view of the drafting of the site’s management plan.

Key words: management of World Heritage Monuments, Thessaloniki, Sustainable Development

**Key words:** management of world heritage monuments, Thessaloniki, cultural tourism, everyday life

### 1.Introduction-Historical Outline.

Thessaloniki, the second largest Greek city, after the capital Athens, is located in Northern Greece and belongs to the geographical region of Macedonia (in the Administrative Region of Central Macedonia). It is built at the cove of Thermaikos Gulf, in a strategic position for communication and trade, controlling the trade routes from the Balkans to the Aegean Sea and from the eastern coast of Asia (Asia Minor - modern Turkey) back to the Balkans, but also, via the sea, to the Adriatic Sea and the West. Apart from a strategic port, a fertile plain is formed to the west of the city, at the mouth of four rivers (Axios, Loudias, Gallic , Aliakmonas). In addition, the city 'touches' on Mount Chortiatis, while two lakes (Megali and Mikri Volvi) are located in the wider area to the east. These advantages of its geographical position and geomorphology were probably the criterion for its foundation during the Hellenistic period (315 B.C) by Alexander the Great's general and later king of the kingdom of Macedonia, Kassandros, and the basis for its economic and cultural development in the following years. They were, probably, also the reason why during its long history and despite the periods of decline, the city was never abandoned.

During the Roman period, the city flourished and became the seat of the eastern province of Macedonia and later the capital of the part of the empire (the system of tetrachy) ruled by Caesar Galerius (Trakasopoulou-Salakidou 1986, 40-42, Veleni 2009, 63-65). Testimonies of this glorious period of the city, the buildings erected by Galerius, remnants of which are more or less preserved to our days: the palace, the Hippodrome, the triumphal arch (Kamara) and probably the mausoleum of Galerius (Rotunda) (Veleni 2009, 74-75).

The prosperity of the city continued during the Byzantine period. The 5th century was a milestone in the history of the city, during which the defensive fortification of the city was constructed and magnificent temples were erected, typical examples of Byzantine temple architecture (Papazotos 1985, 9). The next great cultural heyday would come in the 14th century, when historical circumstances would allow Thessaloniki to play a leading role in this last period of the Byzantine Empire. This splendour would be reflected in the elaborate architecture of the temples of the period and the impressive paintings that adorned them, which would have a significant influence on the art of neighboring states (especially Serbia) (Papazotos 1985,14).

After the fall of the city to the Turks, its position in the region will continue to be important, as a main port of the Ottoman Empire. The Muslim monuments, secular or religious, erected at that time testify with their size and their grandeur the great importance and prestige of the city. A turning point in the 15th century was the arrival and settlement of a significant Jewish population (coming from Spain after the persecutions launched by Ferdinand and Isabella of Spain) which changed the composition of the population (Mazower 2005,47-49) and left its own imprint on the city's building stock. The multicultural Thessaloniki would continue its course through periods of prosperity and decline as a city of the Ottoman Empire until the beginning of the 20th century, when the Balkan wars would bring Thessaloniki into the territory of the Greek state and gradually eliminate its multi-ethnic character. The fire of 1917, which destroyed a significant part of the centre of the Ottoman city and its buildings (Mazower 2005,318-321) and the redesign of the city according to

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

European standards<sup>12</sup>, had a decisive influence on the city's building stock and its subsequent form.

A second major natural disaster that would affect many buildings, including the city's monuments, occurred towards the end of the 20th century, in 1978, when a strong earthquake hit the city. In the meantime, the Greek-Jewish population of the city was exterminated by Nazis during the Second World War.

In 1988<sup>13</sup> (almost 37 years ago)<sup>14</sup> the majority of the monuments belonging to the prosperity phases of the Byzantine era, were inscribed on the UNESCO World Heritage List under the title “Palaeochristian and Byzantine Monuments of Thessalonika”, on the basis of specific criteria (i,ii,iv)<sup>15</sup>. This international recognition of the historical and artistic importance of Thessaloniki's monuments created many opportunities for the monuments and the city of Thessaloniki but also many obligations for the administrative bodies and eventually for the Greek state to fulfil regarding their protection and management.<sup>16</sup>

### **2.Thessaloniki's World Heritage Monuments-some observations.**

Thessaloniki's World Heritage Site comprises fifteen (15) monuments dating back to the Early Christian and Byzantine periods, from the 4th to the 15th century. Most of them are Byzantine churches<sup>17</sup>, while the secular buildings are limited to the Byzantine fortifications

---

<sup>12</sup>The new design of Thessaloniki was made by Ernest Hebrard with the responsibility of a state appointed Committee consisting of Greek, French and British experts (Mazower 2005, 324, Yerolympos 2007).

<sup>13</sup>The World Heritage Convention was ratified by law in 1981 (Law 1126/1981) and the first Greek inscription on the list took place in 1986. It was an ancient Greek temple of the classical period, the temple of Apollo Epicurius at Bassae of Figaleia (Peloponnese).

<sup>14</sup> We cannot fail to mention the article of Demetrios Zygomalas ( Zygomalas 2023) which also deals with the WHM of Thessaloniki and the impact of their status but sets different axis of examination.

<sup>15</sup>Criterion (i): The mosaics of the Rotunda, Saint Demetrius and Hosios David's (Latomou Monastery) are among the great masterpieces of Early Christian art. Criterion (ii): The influence of the Thessalonian churches on the development of the monumental arts was considerable first in the Byzantine and later the Serbian world, whether in the Early Christian period, the Middle Byzantine era or the Palaeologan Renaissance. Criterion (iv): The Christian monuments of Thessalonika are outstanding examples of churches built according to central, basilical and transitional architectural types over a period going from the 4th to the 15th century. For this reason, they constitute a series which is a typological point of reference.

<sup>16</sup>The engagement with this topic is in the context of a PhD thesis on the policies for the protection and management of UNESCO Sites in Greece that I am working on at the University of Macedonia, Department of Balkan, Slavic and Oriental Studies.

<sup>17</sup>Church of Acheiropoietos, Church of Saint Demetrios, Latomou Monastery, Church of St. Sofia, Church of Panagia Chalkeon, Church of St. Panteleimon, Church of the Holy Apostles, Church of St. Nicholas Orphanos, Church of St. Aikaterini, the Transfiguration of the Saviour, the Katholikon (main church) of the Vlatadon Monastery, Church of Prophitis Ilias.

---

(the 4km long city walls and the Acropolis fortress called “Heptapyrgio”), the emblematic monument of Rotunda (Roman construction with Early Christian mosaics), probably originally a funerary building (see above), and a Byzantine bath unique to the period<sup>18</sup>.

The World Heritage Monuments (WHM) of Thessaloniki have some specific characteristics:

1. First of all their great number. Thessaloniki with its fifteen WH monuments is one of the European cities with the greater concentration of Unesco monuments<sup>19</sup>.

2. Secondly, the great dispersion of the monuments throughout the urban fabric. Unlike the historic city centres or other Unesco designated groups of monuments that form ensembles<sup>20</sup>, the World Heritage Monuments of Thessaloniki are scattered within the boundaries of the so-called “historic centre”, the commercial heart of the modern city. This area, bounded by Pavlou Mela Street to the east, Kassandrou Street to the north, the Western City Walls and the old port to the west, and the seaside promenade (Palia Paralia) and the White Tower to the south, is designated as “historical place”<sup>21</sup>.

A second area with important density of WH monuments is Ano Polis (the Upper Town), the traditional settlement developed during the Ottoman occupation on the slopes of a hill, (now at the outskirts of the periurban forest of Seih-Sou) and defined by Olympiados street to the south and by the outline of the Byzantine City Walls to the other three sides. This separate entity with medieval characteristics (Vyzantiadou and Selevista 2019, 719) has also been designated since 1979 as “traditional settlement”<sup>22</sup> and enjoys a special protection status.

The way the Unesco monuments have been integrated in the urban fabric of these two separate areas varies<sup>23</sup>. The space around the WH monuments is not always treated in the same way<sup>24</sup>. In some cases, the monuments are the centre of shaped squares (Rotunda,

---

<sup>18</sup> For extensive historical information and archaeological documentation on the WHM see: “I Thessaloniki kai ta mnimeia tis”, Ephoreia Byzantinon Archaioiton, 1985, Thessaloniki, Kourkoutidou-Nikolaidou and Tourta 1997, Tzevreni 2013.

<sup>19</sup> The serial property “Early Christian Monuments of Ravenna”, Italy, consists of eight (8) monuments.

<sup>20</sup> For example, Historic Centres of Rome or Florence in Italy or the Old City of Rhodes in Greece and ensembles like the Piazza del Duomo, Pisa.

<sup>21</sup> Ministerial Decision YPPO.DILAP/C/73046/51009/1994 (FEK 833/B/1994): Designation of the historical centre of Thessaloniki as “Historical Place”.

<sup>22</sup> G.G.I. Designation of Ano Poli Area of Thessaloniki as Traditional Settlement. 197/D/2-4-1979. 1979, pp. 2323–2325.

<sup>23</sup> The Committee, responsible for the replanning used the churches as a starting point for the new layout, in order to highlight them, according to the architect and member of the Committee K. Kitsikis Kostantinos, Kitsikis, I ktiriologiki apopsis tou Neou Shediou Thessalonikis, Athens: Blazoudakis, 1919, p.12. (Amygdalou 2014, 154 footnote 308). This plan reflects the ideological and political choice of the planners to promote the byzantine past of the city (Yerolymou 2007 7-9)

<sup>24</sup> Only in few of the monuments there is a designated buffer zone and wherever has been delimited, is defined on the basis of the existing enclosure of each monument (Unesco, State of Conservation of World Heritage properties in Europe, Section II, Greece, Palaeochristian and Byzantine Monuments of Thessalonika, par.2, 2006)

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Acheiropoiitos, St. Sofia., St. Demetrius), in others are surrounded by gardens that form an oasis of greenery and tranquility in the bustling concrete city-centre (St. Panteleimon, Panagia Chalkeon) or in the picturesque labyrinth of Upper Town (St. Nicholas Orphanos, Moni Latomou, St. Aikaterini)<sup>25</sup>. In some cases, there is no free space at all around the monuments. The reasons for this variation go back to the replanning of the city after the great fire of 1917, where some of the byzantine churches were used as starting points of the new layout (Yerolympos 2007 7-9, Amygdalou 2014, 154 footnote 308). The plan was only partly implemented for a variety of reasons (Yerolympos 2007, 14-16). For the rest of the monuments their surrounding area was formed accidentally and gradually by modern building activity. In the case of the Byzantine Walls, parts of the Unesco monument had been incorporated into the Minor Asia refugees' small houses, “castroplika”, some of which have been chosen to be preserved and enhanced together with the walls, while others were demolished in order to develop a green zone around the walls (Tokmakidou and Kaltapanidou 2015, 28,30). As to the churches, many of them appear unexpectedly and suffocatingly intertwined with the contemporary multi-storeyed buildings (polykatoikies) of the decades 60's and 70's. Often, there is no free space enough for their enhancement, there is no surrounding area and in most of the cases there is no buffer zone. The Transfiguration of the Saviour and the Byzantine Bath are two of the most characteristic examples where the byzantine Unesco monuments constitute the small stone garden for the massive apartment buildings.

As a consequence of their integration in the modern urban web, the monuments suffer from all the problems of a modern Greek city such as excessive and anarchic building, lack of open spaces, air pollution, noise pollution, vehicle traffic, accumulation of large amounts of waste, graffiti, etc.

On the other hand, this spatial proximity has created a special relationship between the residents and the monuments (Loukaki 1996,66). Through intimacy cultivated by everyday contact the monuments continue to be invested with memories and emotions and to demand a role in the life and imaginative of the inhabitants. For the visitor of the city, they are-at least some of them- like hidden secrets intriguing him to discover, difficult to find sometimes, but when he does, they offer him a pleasant surprise and a relief from the concrete modern city.

3.A third characteristic of Thessaloniki's WH Monuments is the coexistence with other monuments within the boundaries of the urban units mentioned above, which are also designated, as “historical place” and “traditional settlement” respectively. The Unesco monuments coexist with other architectural monuments of various periods and various cultures (roman, other byzantine monuments not included in the World Heritage List, ottoman and modern ones), remnants and material testimonies of the rich history of the city and the uninterrupted habitation around the same core since its foundation. This range of monuments and sites comprises roman palaces and forums, arches, byzantine churches, ottoman baths and mosques, markets and commercial galleries, fountains, imposing jewish mansions and houses of eclectic architecture of 19<sup>th</sup> and early 20<sup>th</sup> centuries and early industrial buildings, like the

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

port and its depots. Sometimes, the WH Monuments and the ones that are not listed as Unesco form part of the same architectural ensemble, as in the case of Rotunda and Galerius palace.

As a result, a special urban landscape has been formed, anarchic but rich in architectural variety, historical references and memories, a landscape with which the UNESCO monuments are inextricably intertwined.

4. A fourth characteristic of Thessaloniki's WHM is the religious use of the majority of them. The byzantine churches, as they preserve their original use, belong to the so-called "living cultural heritage" (Poulios 2014,115) and are associated with intangible elements, spiritual content and worship practices.

The secular monuments (the Byzantine Walls, Rotunda<sup>26</sup> and the Byzantine Bath) are used occasionally for cultural events (concerts, exhibitions), while the fortress of Heptapyrgion houses nowadays<sup>27</sup> the premises/offices of the Ephorate of Antiquities of Thessaloniki City (the competent for the protection of the monuments service of the Ministry of Culture) and it is also open to visitors.

5. As a result of Monuments' great insertion in the urban tissue and their use, there is a large number and variety of users: residents, visitors-tourists, the members of the Greek-orthodox community, the employees of the Ministry of Culture, the audience of the cultural events and also some special categories of visitors like scholars and the members of the educational community (students and teachers of the city's schools and Universities who visit the monuments for educational purposes). We could also add other categories of involved stakeholders like the businessmen in the surrounding area of the monuments and the property owners.

6. In the same way, there is also a great number of authorities involved in the protection and management of the WH Monuments: Firstly, the ministries and services competent for the supervision of the "historical place" of the historic centre and for the "traditional settlement" of the Upper Town. Respectively, these services are: the Ephorate of Modern Monuments and Technical Works, Ministry of Culture, also responsible for the protection of listed individual buildings of the modern era in the surroundings of Unesco monuments<sup>28</sup> and the Department of Traditional Settlements and Listed Buildings of the Ministry of the Interior, with further competencies in the protection of some of the modern buildings which sometimes overlap with the competencies of the Ephorate of Modern Monuments (Vyzantiadou and Selevista 2018,724), as there are designation decisions of both ministries. This overlapping of competencies has a negative impact on the protection of all listed monuments.

Secondly, the two different municipalities, in the area of which the WHM are located. The majority of them are found within the limits of the Municipality of Thessaloniki, while

---

<sup>26</sup> Rotunda functions also as a church for the limited number of twelve liturgies (one per month) every year.

<sup>27</sup> The fortress was converted into a prison at the end of the 19th century by the Ottoman administration. After 1912 and the liberation of the city it was used by the Greek administration for the same purpose. Its operation as a prison was interrupted after complaints and judicial tensions in 1989, and afterwards the Heptapyrgio was assigned to the Ministry of Culture, Eptapyrgio: The Acropolis of Thessaloniki (2001), Exhibition catalogue, 9th Ephorate of Antiquities of Thessaloniki, Thessaloniki

the northern-eastern part of the Byzantine Walls falls within the boundaries of the Neapolis-Sykies Municipality. Moreover, responsible for the operation of the monuments in the context of their regular religious use are the Ecclesiastic authorities, mainly the Holy Metropolis of Thessaloniki and secondly the Holy Patriarchate of Constantinople to which the Monastery of Vlatadon and the St Nikolaos Orphanos (metohi of the Vlatadon Monastery) belong. Last and most important, the Ephorate of Antiquities of the City of Thessaloniki, the competent regional service of the Ministry of Culture, together with the Central Service of the same Ministry and the Central Archaeological Council, which supervise and coordinate the protection and management of all Unesco monuments in the Greek territory, are the main official bodies for the protection and management of Thessaloniki's Unesco Monuments.

### **3. World Heritage Convention and Sustainable Development-The framework of the research**

After their inclusion in the World Heritage Convention, the monuments of Thessaloniki entered a special category of increased prestige and recognition, which implies, at least theoretically, significant benefits for the city that hosts them: economic and developmental benefits in the context of tourism and especially cultural tourism, and social benefits as the monuments' high status is supposed to raise the self-esteem of the city's residents and consequently to foster the community's cohesion and feeling of local identity.

On the other hand, their inclusion in the World Heritage List created increased demands for their conservation, in terms both of human and material resources, while their protection against damage and distraction became an absolute priority which sometimes contradicts developmental projects and constructional activities.

To resolve this contradiction, the World Heritage Convention has stated<sup>29</sup> the concept of sustainable development; that each State-party “shall endeavor to adopt a general policy which aims to give the cultural and natural heritage a function in the life of the community and to integrate the protection of that heritage into comprehensive planning programmes (article no 5(a))<sup>30</sup>”. In the framework of the Convention, the concept of sustainable development will be further explained and enriched by the Budapest Declaration and the 5 Cs: Credibility (of the List), Conservation, Capacity Building, Communication and Communities as main pillars of sustainable development<sup>31</sup>.

Most recent development, under the influence of the 2030 Agenda of the United Nations for Sustainable Development<sup>32</sup>, is the adoption of a policy for the “*Integration of a*

---

*Sustainable Development Perspective into the Processes of the World Heritage Convention”* which emphasizes the dimensions of: Environmental Sustainability, Inclusive Social Development (underpinned by inclusive governance), Inclusive Economic Development and Fostering Peace and Security (in case of war, civil conflict and all forms of violence)<sup>33</sup>. Two of them, the Inclusive Social Development and the Inclusive Economic Development are the most relevant to the case of Thessaloniki’s Unesco monuments, and to urban heritage in time of peace. For the integration of a sustainable development perspective, the mentioned dimensions are analyzed in strategic Objectives, as following:

*Strategic Objectives:*

*Inclusive Social Development (III,17-23, p.6-8)*

- Contributing to inclusion and equity
- Enhancing of quality of life and well-being
- Respecting, protecting and promoting human rights
- Respecting, consulting and involving indigenous peoples and local communities
- Achieving gender equality.

*Inclusive Economic Development (III, 24-27, p.8-10)*

- Ensuring growth, employment, income and livelihoods
- Promoting economic investment and quality tourism
- Strengthening capacity-building, innovation and local entrepreneurship

The main tool, according to Unesco’s guidelines (2005)<sup>34</sup>, which should specify how the outstanding universal value of a property should be preserved, preferably through “participatory means”, (UNESCO: p. 26, par. 108) and the way and means to achieve the strategic objectives mentioned above is the Management Plan (or any other documented management system) which from 2005 onwards became obligatory for all inscribed sites and a prerequisite for every new inscription. The management plan constitutes the basis of effective management and includes, among others, a thorough shared understanding of the property by all stakeholders, a cycle of planning, implementation, monitoring, evaluation and feedback and the involvement of partners and stakeholders (Operational Guidelines 2005, par.108).

A mechanism of monitoring the implementation of the declared policy has also been established under the World Heritage Convention, called “Periodic Reporting”<sup>35</sup>. Every six years or so, the States Parties are invited to submit to the World Heritage Committee a Periodic Report on the implementation of the World Heritage Convention in their territory.

---

The process lasts for a period of six years approximately and is conducted through questionnaires completed by the responsible site managers in each country. Information on legislative and administrative provisions and other actions taken for the application of the Convention is provided. These questionnaires are sent to the World Heritage Centre where regional reports are developed (Greece belongs to the region of Europe and North America, subregion of Mediterranean). Then the regional reports are examined by World Heritage Committee and recommendations are formulated to the State Parties on compliance with the objectives of the Convention. In the final stage, regional action plans are created, setting priorities and goals at a regional level<sup>36</sup>. Two cycles of Periodic Reporting have been completed until now-2006 and 2015-and a third one began in 2018 and is still ongoing.

### 4. Working hypothesis and Methodology

Regarding the research on the policies for protection and management of Thessaloniki's WH Monuments our aim is to examine to what extent the Unesco's policy for the integration of a sustainable development perspective in the processes of World Heritage Convention is implemented in the case of the WHM of Thessaloniki, focusing to the social and economic dimensions and their strategic objectives, some of which were used as the base of the field survey and as axes for our analysis. The strategic objectives which were chosen as the most suitable for the case of Thessaloniki were: the “contributing to inclusion and equity”, the “enhancing of quality of life and well-being” and the “respecting, consulting and involving indigenous peoples and local communities”, as to the inclusive social development dimension, and the “ensuring growth, employment, income and livelihoods and “promoting economic investment and quality tourism”, as to the inclusive economic development dimension.

A series of questionnaires has been developed to be delivered to certain groups of users (university students, citizens and residents-members of Non Governmental Organizations active in the protection of the monuments, professional guides, tourists) together with a series of semi structured interviews addressed to experts and responsible managers of the main bodies involved in the management (public, municipal and ecclesiastic authorities) of the monuments. At the same time a systematic recording and documentation of the state in and around the monuments is taking place through regular visits. The questionnaires of the three cycles of Periodic Reporting (2006, 2015 and 2023-still under process) answered by the responsible for the site's management public body—the Ephorate of Antiquities of the City of Thessaloniki were used as a guide for the formulation of the main research questions and the elaboration of the survey questionnaires and interviews. The research focuses on the event of the visit to the World Heritage Monuments and the issues connected to it. The visit is, in our opinion, the crucial event for the interaction of the monument with the public and a reliable indicator of the achievement of the goals of Unesco's sustainable development policy.

The survey is still ongoing but the first results seem to confirm and enrich with more quantitative data and qualitative details the questionnaires of the Periodic Reporting and the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

observations made on the field. These latter form the basis of the remarks on the management of the site we are going to present here.

### **5.The management of Thessaloniki’s World Heritage Monuments: some remarks on the management system and emerging issues**

In the case of Thessaloniki, there is no management plan and this is the situation for the majority of the sites of the Greek World Heritage List<sup>37</sup>. The management system of Unesco’s Monuments hasn’t changed much since the date of inscription, 1988. The Ephorate of Antiquities of the City of Thessaloniki (regional service of the Ministry of culture) is the responsible body for the protection, and the Central Service of the ministry supervises and coordinates all the works and activities concerning the WHM.

The legal framework for the protection of Thessaloniki’s Unesco monuments (and of Unesco Monuments in general) is the Law 4858/2021 “Codification of the law “On the Protection of Antiquities and Cultural Heritage in general” (known also as Archaeological Law)<sup>38</sup> and the competent Ephorate of Antiquities is the main governmental body responsible for its implementation.

The main obligation for every State Party of the World Heritage Convention is to preserve the outstanding universal value of the site together with integrity and authenticity (<https://whc.unesco.org/en/list/456>). Under the supervision and guidance of the Ephorate many conservation and enhancement works have been carried out in the monuments, in some cases with great success, like the exemplary restoration works in St. Panteleimon (the Europa Nostra award 2000) and the enhancement of the outer perimeter of the eastern part of the Byzantine Walls. Since 2022 a major program of restoration and enhancement of many monuments inserted in the urban web, the Unesco monuments among them, is running<sup>39</sup>. Moreover, the Ephorate controls the surrounding area of the monuments imposing prohibitions and restrictions in constructional works and various activities (commercial and recreational) in order to protect effectively the WH monuments.

---

<sup>37</sup>Only three of the inscribed sites of the Greek World Heritage List have management plan: the Old Town of Corfu (inscribed in 2007), the archaeological site of Philippoi (inscribed in 2016) and Zagori Cultural Landscape (inscribed in 2023). The project of the Ministry of Culture “Drafting of management plans for the monuments and sites of Greece inscribed in the World Heritage List of UNESCO” aimed to fulfill this obligation towards Unesco. It was initiated in 2018 and had as deadline the end of June 2022. The outcomes are still anticipated.

<sup>38</sup> There are also separate Ministerial Decrees for each monument which define boundaries and specific terms of protection.

<sup>39</sup> The conservation programme is funded by Recovery and Resilience Facility Loans and ESPA (Corporate Pact for Development Framework) and comprises the following Unesco monuments: the **churches of Acheiropoitos**, St. Sofia , Panagia Chalkeon, St. Aikaterini, St. Nicholas Orphanos, Profitis Ilias, Rotunda and the Byzantine Walls (northern and western parts).

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Despite the efforts of the Ephorate, the surrounding area often does not contribute to the enhancement of the monuments and their value, due to factors related to the major problems of the city referred above (lack of open spaces which could have been designated as buffer zones and could have been landscaped, concentration of garbage bins in the vicinity of the monuments, air pollution, noise pollution due to the vehicles' circulation and sometimes to the establishment and operation of entertainment businesses in the area near the monuments.), problems which the Ephorate is not the only competent to address and often has not the means to solve, and the solution of which depends on other bodies and authorities (partly on the municipal authorities)<sup>40</sup>. The involvement of the administrative bodies and services responsible for the numerous listed buildings in the surroundings of the World Heritage Monuments and the wider protected ensembles of the “historical place” and the “traditional settlement” (the Ephorate of Modern Monuments and Technical Works and the Department of Traditional Settlements and Listed Buildings) make the task of protection even more complicated.

Another factor affecting the state of many of the monuments is their regular use as churches. As some scholars observe, the coexistence in a religious site of secular and religious values amplifies the contrast between private and collective interests further increasing the level of management complexity (Presti and Petrillo 2010, 306). Special facilities and equipment are demanded for the conduction of liturgies and other ceremonies, while sometimes interventions take place (like repairs, changes of flooring, painting of walls, installations of lighting or heating and cooling appliances) incompatible with the character of the monuments with the responsibility of the Ecclesiastic authorities and against the restrictions and prohibitions imposed by the Ephorate<sup>41</sup>. The needs and demands of the users, who attend the liturgies or participate in special ceremonies and events such as weddings, baptisms, etc., have also impact on the state of the Monuments, sometimes negative. For example, it is not rare the courtyards of the churches to be used as parking areas by the participants in these religious mysteries and social events.

The lack of coordination among the different Services, bodies and authorities has a serious impact on the state of the monuments and a subsequent negative effect in the enhancement of the monuments degrading their surrounding area and the quality of the visit. This fragmentation extends to other aspects of the protection and management such as the presentation and promotion of the distinguished assets on the internet. This becomes obvious even from the initial stage, when someone attempts to collect the necessary information for the organization of the visit. Each of the involved bodies and authorities provides in its website the part of the information considered the most significant depending on the organization's character and interests. For example, the Ephorate is more concerned for the

---

<sup>40</sup> These problems were created during the evolution and transformation of Thessaloniki in a modern Greek city and unfortunately constitute the pathology of the majority of Greek cities.

<sup>41</sup> The relations between the two bodies vary from an harmonious cooperation to a deep conflict depending on the circumstances and the specific persons involved every time. Characteristic is the case of Rotunda the function of which was at the heart of the dispute between the Ministry of Culture and the Ecclesiastic authorities.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

presentation of the scientific content of the monuments<sup>42</sup>, the Holy Metropolis is interested in the religious function, the Municipality of Thessaloniki<sup>43</sup> tries to promote the monuments as major visitor attractions and main component of the city’s unique cultural identity<sup>44</sup>. There are also other stakeholders in the tourism sector like the NGO “Tourism Organization of Thessaloniki” and many private travel agencies that promote the visit to the Unesco Monuments of the city<sup>45</sup>. In any case, the information is never complete (Zygomalas 2023, 28). A crucial element for the organization of a visit, that is usually missing, is the opening hours of the monuments. The opening hours differ between the secular and religious monuments, as the first ones are supervised as to their operation by the Ephorate and the religious ones by the Metropolis. The access to the monuments is also another problematic point for the organization of the visit as specific instructions concerning the means of transport or the traffics’ circulation are usually absent<sup>46</sup>. As a result, organizing a visit to the monuments, especially to some of them is not such an easy task.

In a second stage, during the visit, there are other problems for the visitor to face. There is no visitor’s management plan for any of them and the visitor has no guidance as to his movement into the monument. There are no visitor facilities like rest areas and toilets and things become even more difficult for persons with special needs and disabilities or for other categories of the population like mothers with pushchairs and babies. We have to mention the realization, with the responsibility of the Ephorate of Antiquity of the City of Thessaloniki, of

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

the project “Prospelasis” a very important effort to improve the monument’s accessibility<sup>47</sup>. In the framework of this program, interventions were carried out in six of the fifteen World Heritage Monuments<sup>48</sup>. The interventions aimed to improving physical and sensory accessibility and in general included installations of lifts, metal platforms and ramps (and an accessible toilet in one case) and of wi-fi information systems. It has been almost 15 years since this remarkable effort, and it has been no extension to the rest of monuments, neither follow up to the previous ones.

Moreover, there is no in situ information, neither digital nor printed, especially in many of the religious monuments. There are some signs placed by the Municipality of Thessaloniki which provide only some basic information on the monuments and without any reference to the World Heritage status<sup>49</sup>. So, in case of individual visitors not accompanied by a professional guide, a previous preparation and knowledge is demanded, otherwise is difficult to understand the historical and artistic importance of the monument and to appreciate its unique universal value.

All the factors mentioned above, the major problems of the city that affect the state of the surrounding area, the problems caused by the religious function of the monuments (desirable as it is the original use but sometimes problematic), the fragmented and ultimately incomplete presentation of the monuments on internet, the lack of scheduled visit and visitor facilities and of in situ information in the majority of the monuments, are degrading the visitor’s experience. Moreover, there is no connection to tourism industry and the private sector (commercial and recreational activities, enterprises in the surroundings of the monuments). As a consequence, the ability of the WHM monuments to function as major attractions for cultural and religious tourism is shrinking and this fact affects negatively the achievement of the objectives of Inclusive Economic Development.

Specific categories of visitors are more related with the social dimension of sustainable development like the members of the educational community of Thessaloniki, pupils and students of the numerous primary and secondary schools of the city and students of the universities<sup>50</sup> with their teachers and professors. For all of them, the monuments constitute an important educational resource which remains to a considerable extent unexploited. Educational programs and guided tours adapted to the different ages and educational needs are very limited<sup>51</sup>, due to various reasons, mainly to the lack of staff and to the many and

---

<sup>47</sup>The other partner of the project was the Aristoteleion University of Thessaloniki, Research Group for Transportation System (coordinator: professor Aristoteles Naniopoulos) <http://prospelasis.com/project/antikeimeno-stoxoi-toy-ergoy> accessed on 04/09/2025

---

complicated other duties the staff the staff of the competent Ephorate has to accomplish. So, usually the educational success of the visit depends on the initiative and good will of the teachers and professors or on the knowledge and inspiration of a professional guide. Apparently, it has not been established a regular and systematic communication and cooperation between the managerial authorities of the Monuments and the educational institutions of the city.

The same is true for the organization of cultural events, usually with the initiative of municipal or regional authorities who ask for the permission of the Ministry of Culture to use the Monuments-a difficult and time-consuming process. The Central Archaeological Council is the responsible body to grant the permission and impose terms and restrictions on the event in order to protect the monuments (number of spectators, kind of equipment, etc.) upon the suggestion of the competent Ephorate. As a result, the number of cultural events is relatively limited and their occurrence is irregular. A bright exception, two cultural institutions that have been created recently, the Heptapyrgion Festival, an initiative of the Prefecture of Thessaloniki in cooperation with the Ephorate which since 2019<sup>52</sup> takes place in the fortress of Heptapyrgion every summer, and the Worship Week, an initiative of the Municipality of Thessaloniki<sup>53</sup> under the aegis of the Holy Metropolis of Thessaloniki, which, since 2024, takes place mainly in the WH Monuments of Thessaloniki (Rotunda, St. Demetrios, St. Sofia, Acheiropoiitos) one week before the Passion Week.

The difficulties and deficiencies before and during the visit affect negatively the frequency and the quality of the visitor's experience. The interaction of the monuments with the public (the general public or specific segments of it like the student population or the audience of cultural events) remains limited and to a certain degree superficial and WH Monuments' potential for education, equity and well-being is not fully exploited. Moreover, citizens and local communities are by law excluded from the management of the Monuments. Nevertheless, we cannot fail to mention the organizations of citizens and residents active in the protection of the city's monuments, among them the UNESCO ones, like the “Friends of the Historical Centre of Thessaloniki”, “Friends of Thessaloniki's Monuments”, “Friends of Rotunda” and others.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

As a consequence of the above, the objectives of Inclusive Social Development, the citizens' wellbeing and the local communities' participation are difficult to achieve, under the circumstances.

These field observations are confirmed by the assumptions of the competent Ephorate of Antiquities to the questions of the Periodic Reporting questionnaires. So, as to the inclusive economic development, the Ephorate admits that there is only some flow of economic benefits to local communities (Periodic Reporting 2014 par.4.4.5,) while the relationship and the cooperation of the World's Heritage property managers with tourism industry is characterized as “fair” in 2014 (Periodic Reporting 2014 par.4.3.7) and “good” in 2023 (Periodic Reporting 2023, 5.3.16.10), although admitting that, regarding to improving the visitor's experience, the contact is “largely confined to administrative and regulatory matters” (Periodic Reporting 2023 9.11).

As to the adequacy of the visitor facilities and services for education, information, interpretation and awareness building, the situation doesn't seem to have significantly changed since 2006 and is characterized as “poor” in the questionnaire of 2023, the website and other online information included (Periodic Reporting 2023, 8.4). Additionally, the existent planned education and awareness programme only partly meets the needs of the public and could be improved, consequently and the influence of World Heritage status on education, information and awareness building activities (Periodic Reporting 2014 4.6.3). Especially for children and youth there is “a limited and ad hoc education and awareness programme” (Periodic Reporting 2023, 11.8.2.)

As to the role of local communities, since 2006 it is stated that it is not possible to involve local people in the management (Periodic Reporting 2006, par.11), as there are no mechanisms for participation (Periodic Reporting 2023, 5.3.15.1.) while the relationship and the cooperation of the World's Heritage property managers with local residents and communities and with local/municipal authorities is characterized as “fair” (Periodic Reporting 2014 par.4.3.7). In the questionnaire of 2023, it is referred only some participation of local authorities (Periodic Reporting 2023,5.3.15.2) but the cooperation is characterized as good (Periodic Reporting 2023, 5.3.16.2).

The extent to which the management system contributes towards achieving the objectives of World Heritage Committee's “Policy for the Integration of a Sustainable Development Perspective into the Processes of the World Heritage Convention” is rated as “full achievement” for social inclusion and equity (Periodic Reporting 2023 5.3.17.3.) and as “significant” to fostering inclusive local economic development and to enhancing livelihood (Periodic Reporting 2023 5.3.17.5).

### **6. Some thoughts on a different approach for the management of Thessaloniki's WHM**

It becomes evident that the current management system is not capable to achieve the strategic objectives and the targets of Inclusive Economic and Social Development perspective. The complexity of problems in an urban context in combination with the overlapping

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

competencies and the lack of coordination<sup>54</sup> among different administrative bodies and levels of administration don't support the implementation of inclusive policies of sustainable development. The system seems more successful as to the conservation of the monuments and the implementation of a consistent conservation policy<sup>55</sup>. As to the visitor's experience, some great efforts have been done in the past, like the “Prospelasis” project but unfortunately since then it has been no continuity or follow up. Regarding the use and the conduct of cultural events, the initiatives of local authorities and the establishment of synergies with the Ephorate of Antiquities and the Holy Metropolis have been proven effective for the creation of institutions like the Heptapyrgion Festival and the Worship Week. These few successful examples offer a strong argument for the importance of the establishment of a stable status for participation and cooperation of all the involved stakeholders.

The Unesco's requirement for inclusive governance presupposes the institutionalized participation of all stakeholders with clear and defined responsibilities in a single management body. This steering group could take quick and effective decisions and propose comprehensive solutions, taking into account the dimensions of economic and social sustainability.

In the core of such a proposal lies a different notion for the object of protection. Though they do not form a coherent in the space ensemble, Thessaloniki's WH Monuments should not be treated as isolated, separate monuments.

In our opinion, a landscape approach would be more suitable for the case of Thessaloniki because of all the special characteristics mentioned above. The great number of monuments, the loss of their original context, their strong spatial integration in the tissue of the modern city, the dispersion in the designated areas of the Historical Centre and Upper Town, the coexistence with numerous other important monuments of various eras together with the contemporary buildings, the combination of tangible and intangible heritage in the religious monuments, the variety of users and stakeholders, and finally the specific geographical position and topographical features (peril of the impact of Climate change) of the city advocate for the usefulness of a broader concept as the basis for their management. Unesco's Recommendation (2011) on Historic Urban Landscape, a tool which has not been utilized until now (Periodic Reporting questionnaire 2023 5.3.5) offers perhaps an alternative basis for the management of Thessaloniki's monuments.

The Recommendation recognizes the results of rapid and uncontrolled urbanization, like the excessive building density, the loss of public spaces, the standardization and monotony of the building environment, the debilitating poverty and the social isolation, the increasing risk

---

<sup>54</sup>According to the 2023 questionnaire, paragraph "Identification of Priority Management Needs": “There is coordination between the range of administrative bodies involved in the management of the property, but it could be improved “(2023, 11.1.5.3.11).

<sup>55</sup>This management system is very close to the so-called “material based approach” of heritage conservation which focuses on the preservation of the material fabric (Poulios 2014a 19, Poulios 2014b, 17) and is driven by experts, mostly state-appointed heritage authorities manned by conservation professionals while community is not taken into account (Poulios 2014b,18). The difference, in our opinion for the case of Thessaloniki's monuments, is that the Holy Metropolis is also actively involved as the main administrator of the religious use.

## PROCEEDINGS

---

of climate relating disasters and finally the social and spatial fragmentation and the deterioration of the quality of life in urban areas. It considers urban heritage a key resource in fostering economic development and social cohesion and in achieving a balance between urban growth and the quality of life on a sustainable basis (Introduction.3).

According to the Recommendation’s definition, the “historic urban landscape” is an urban area understood as the result of an historic layering of cultural and natural values and attributes, extending beyond the notion of “historic centre” or “ensemble” to include the broader urban context and its geographical setting (I, par.8)<sup>56</sup>. In the context of the “Historic Urban Landscape” both tangible and intangible heritage are included in equal terms. This broad, unifying and dynamic notion is closer to the complexity of the contemporary landscape of the Historical Centre and the Upper town, where the Unesco monuments are scattered and inextricably linked, spatially and visually, with various other monuments and contemporary constructions, rich in historical references, social memory and cultural meaning. In this context of a rich building stock and of multiple layering due to the uninterrupted habitation, this approach advocates for a shift of urban heritage conservation from individual architectural monuments towards a broader recognition of the importance of the social, cultural and economic processes in the conservation of the urban values (Introduction 4). In this way, the historic urban landscape provides the basis for the identification, assessment, conservation and management within an overall sustainable framework (I.10), involving a variety of stakeholders, including local, national, regional, international, private and public actors (Introduction.6).

Thessaloniki is probably the most appropriate case for the implementation of this Recommendation. In view of the drafting of a Management Plan that the country is obliged to submit at some point in the immediate future, the separate fragmentary initiatives could be organized to consistent policies related to the broader urban context, in the framework of historic urban landscape’s approach. The effective conservation of the Unesco Monuments and of their outstanding universal value cannot be discerned from the rest of the tangible heritage of the city or from their intangible content which continues to be enriched through regular use. The planning of short and long term actions in all related sectors of protection and management and the assurance of their continuity would optimize and add value to the anticipated benefits. The need for coordination of all the involved administrative bodies and the demand for the participation of local communities (local authorities, NGOs of active citizens, and individual residents) could be met by the creation of a single management body. In this way, the conservation policy would integrate with the goals of inclusive economic and social sustainable development policy and the enhancement of the universal value of the distinguished monuments with the interaction of the public with the urban heritage and the subsequent social and economic benefits.

In the case of Thessaloniki’s World Heritage Monuments, the possibility of restoring their original context has been lost forever (perhaps a last chance was the byzantine avenues and monumental squares uncovered during the excavations of the city’s subway). The surroundings of the monuments have changed many times and continue to change, and traces

---

of these transformations are still standing or have been revealed through excavations of the architectural palimpsest of the city. The WH monuments, however, remain constant reference points in the neighborhoods of the Historical Centre and the Upper Town, sometimes more and sometimes less visible, and they are still being made meaningful by the daily movement and activity of the residents and visitors of the town. This landscape may not exactly be compatible with the ideas and requirements of the conventional heritage enhancement, but it is unique. The monuments have become an integral part of the city and can only be treated as such. And then perhaps what at first seems like the most significant threat to the WHM, “the location within the urban tissue of Thessalonika, which is continuously changing” (Periodic Reporting 2006, par. 12), will become the greatest opportunity for the Monuments and the City.

## **THE LEGACY OF HIPPOCRATES IN THE MODERN WORLD AIMING AT WELL-BEING AND SUSTAINABILITY. THE CASE OF KOS.**

**Anda Karayanni**

*Praxis Plus, 101 Amerikis str, Rhodes, Greece*

[info@praxisplus.gr](mailto:info@praxisplus.gr)

### **Abstract**

The aim of the paper is to highlight how the 2500-year legacy of Hippocrates, "Father of Medicine", through his vast scientific work, can be utilized in the modern world, at well-being and sustainability, based on values able to improve our lives with a holistic approach.

If well-being is the result of the “art of living”, then Hippocrates is more relevant than ever to guide us through his valuable advice and the value system that runs through it.

Well-being. Meaning:

- Wellness, Physical and Mental Health, Reflects the quality of the social values.
- “Health is a state of complete physical, mental and social well-being”, Hippocrates said before 2.500 years

Hippocrates the Coan (of Kos) 460 B.C.- 370 B.C. , “Father of Western Medicine”, is the first holistic physician, philosopher and teacher with a 2500-year-old heritage of knowledge .

“HIPOOCRATIC OATH” is the basis of the Geneve Declaration, 1947. It is the most important ethical document for the behavior of the physicians after the World War II.

HIPPOCRATIC GARDEN. At least 250 plants are mentioned in the Hippocratic Collection. His Pharmacology is still the source to identify and isolate several modern medicaments like Aspirin against fever, Coumarines for anticoagulation, Ephedrine against cough, Vincristine against cancer, Tamoxiphen against breast cancer, and many others

Kos transformation, in a sustainable way, with ESG practices can be widely inspired by his advices for health and well-being.

Guest experience in Kos will be inspired from Hippocrates's quotes. We’re sharing his quotes so we can benefit from his wisdom and his philosophy.

Hippocrates is a heritage of Kos. His advices lead Kos the way achieving well-being. The hotels, the destination, can develop a strategy to support the Sustainable Development Goals and actively to implement them.

**Key words:** Hippocrates, Sustainability, Culture, Heritage, Well-being, Kos, Tourism

#### **Abstract**

The objective of this work is to investigate the relationship between Business Information Models (BIMs) in tourism and cultural tourism sustainability, as a foundation for effective destination management. Within the tourism sector, there exists a wide variety of business models, each designed to address specific customer requirements. The competitive environment in which these models are developed, defines their objectives and operational methodologies based on the specific needs they aim to address. By aligning their goals to meet market demands and adjusting their operations accordingly, they ensure their relevance and efficacy within the tourism industry.

The analysis aims to categorize the most well-known and widely used BIMs in the field of tourism services and to collect tourist experience models for travellers to align them (matching) with data and expert activities. BIMs are also utilized to facilitate the creation of extended destination profiles, offering critical insights into cultural resources, tourist demand, and the carrying capacity of a destination. This leads to strategic planning that mitigates over-tourism and supports the sustainable utilization of cultural assets. The fact that these models aid in data-driven decision-making enables the development of policies that prioritize local community participation and integrate their needs into tourism strategies. Through their data analysis and management capabilities, they enhance the development of strategies that promote sustainability, focusing on cultural heritage preservation and supporting local needs. Furthermore, by analysing visitor preferences and behaviors, these models help identify tourists who are inclined towards sustainable practices and cultural appreciation. This ensures the attraction of a visitor base oriented towards sustainability goals.

Another aspect considered in this paper is the use of artificial intelligence in destination management, not only for the deeper understanding of tourists' needs but mainly for stakeholders responsible for creating customised branded experiences rather than uncoordinated visitor experiences. Finally, this paper highlights the significant role of BIMs

---

in connecting tourism development and sustainability, demonstrating their potential for an inclusive approach to destination management. By integrating advanced information models into tourism practices, the paper contributes to a deeper understanding of how technology and data can drive sustainable cultural tourism strategies.

**Key words:** Business Information Models, AI in tourism, cultural tourism, sustainability

### Introduction

Tourism represents one of the most powerful economic and developmental sectors globally but currently, many destinations are unable to effectively respond to the increasing tourist demand and the challenges that come with. Sustainability is now a central focus in the evolution of business models within the tourism sector. The dominant trend is a shift toward integrating environmental, social, and economic sustainability into core business strategies, with growing emphasis on innovation, collaboration, and inclusivity as well as appropriate planning that addresses both emerging challenges and capitalizes on new opportunities. Understanding the impacts and issues associated with sustainable tourism development in business models is essential for focusing on more effective and sustainable management strategies, benefiting both local communities and visitors.

Achieving sustainable tourism management requires balancing the often-conflicting needs and interests of various stakeholders and at the same time recognizing the interconnected nature of these relationships. Managing such dynamics demands for active participation and collaboration among all parties involved, each respecting the role of the others. Moreover, tourism is recognized as a key sector for advancing the UN Sustainable Development Goals (SDGs), with research showing that tourism activities are associated with 14 out of the 17 SDGs. Tourism can positively impact goals such as poverty reduction, gender equality, economic growth, and sustainable communities, but can also have negative effects on goals like health, gender equality, and environmental sustainability if not managed responsibly (Poulimenou et al, 2022; Makhdoom et al, 2024). Sustainable business models in tourism, such as those based on the circular economy or inclusive business practices, are being discussed and implemented to align with the SDGs.

These models focus on reducing negative impacts and maximizing positive contributions to society and the environment (Rosato et al, 2021). Furthermore, there is a move toward transforming traditional business models into green or sustainable business models (SBMs), often requiring significant innovation in products, technology, and organizational processes (Elmo et al, 2020). Taking the above into consideration, this research has been initiated in the framework of a European co-funded project, named “Indiana: Intelligent Management System”, implemented by Ionian University, Corfu Greece in collaboration with DOTSOFT S.A.. The INDIANA project involves the research, design, and development of an innovative platform that disseminates tourist and cultural Points of Interest (POIs) to travelers, on a highly personalized level, with the use of state-of-the-art technologies, Big Data and Artificial Intelligence.

**The Evolution and Significance of Business Models in the Digital Economy and Tourism**

In today's world, both mature and developing tourism markets are indeed facing new conditions that require the redesigning and updating of their strategies. Emerging markets, in particular, are in need to implement robust and innovative marketing strategies tailored to their unique characteristics and needs (Zhao, 2023). Businesses, institutions and policy makers are currently looking for ways to promote and consolidate a sustainable presence, responding to multidimensional tourism behavior (Conti et al, 2023). Over the past decade, the traditional value chain of tourism services has been strongly challenged due to various factors such as intense competition that goes beyond the traditional boundaries of the industry, technological progress that brings about rapid changes in the business environment, diversified tourism behavior in the post-COVID period, new regulatory and normative requirements requiring increased adaptability (Gruchmann et al, 2022). These conditions inevitably lead to a reshaping and re-approaching of the tourism market.

Within this context, the creation, capture and diffusion of business value are re-examined, with business models taking on a central role in both academic research and management practice. Business models research reveals that there is an urgent need for innovation to overcome outdated practices (Geissdoerfer et al, 2018; Velu, 2024), while the analysis of traditional and digital business models showcases that they are characterized by flexibility, scalability, highlights the use of modern technologies (such as VR, AR, booking platforms, Big Data, and Machine Learning) and their interconnection with social networks and digital interaction with customers.

Today, business models have become a central focus in academic research and professional practice, including the tourism sector, as is evident by the literature review. Over the decades, the definition of business models has expanded, covering diverse applications and interpretations. Research by Zott, Amit, and Massa (2011) traces the term's academic origins to the 1970s. DaSilva and Turkman (2014) and Novak (2014) trace its first scholarly mention in 1957. Since then, references to business models have surged, reflecting their growing importance. Researchers and scholars have proposed various definitions: Hamel (2002) describes a business model as "a way of doing business," while Tikkanen et al. (2005) define it as a system composed of structural and cognitive elements. Despite initial critiques of the term as simplistic (Magretta, 2002; Ghaziani et al, 2005; Seddon et al., 2004), business models have gained prominence in academic discourse (Zott et al., 2011; DaSilva et al, 2014; Massa et al., 2017). Baden-Fuller and Morgan (2010) introduced the notion of business models as "templates" that can be replicated.

Early studies linked business models to strategy (Porter, 2001; Magretta, 2002), while George and Bock (2011) explored their integration with theoretical frameworks. Veit et al. (2014) positioned business models as an intermediary layer between corporate strategy and operational processes. The present study adopts the definition by Zott and Amit (2010), which views a business model as a structured set of activities, along with the resources and capabilities necessary for execution, either within a firm or through collaborations with partners, suppliers, and customers. This definition underscores the role of resources and value chains in shaping business operations. The digital era has revolutionized business activities through technologies such as Industry 4.0, the Internet of Things (IoT), cloud computing, big

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

data, and blockchain, reshaping value creation and business practices. The intersection of digital technology and business model innovation is now well-established, with researchers offering diverse interpretations. Some equate digital business models with technology-driven frameworks like IoT-based models, while Katunskis and Neamtu (2016) examine them through the lens of Industry 4.0. Veit et al. (2014) define digital business models as those in which "changes in digital technologies drive fundamental transformations in business operations and revenue generation." This perspective highlights the disruptive impact of information and communication technologies, particularly in the tourism sector. The adoption of digital innovations not only redefines processes and strategies but also necessitates continuous adaptation to evolving market conditions.

A business model defines how a company creates, delivers, and captures value, forming the foundation for revenue generation, customer targeting, and product or service offerings. Key components include cost structures, distribution channels, customer relationships, and strategic partnerships. Common business models range from subscription and freemium to direct sales, franchising, and e-commerce, each providing a structured roadmap for operational success and competitiveness. Tourism business models are diverse, addressing specialized traveler needs. The industry's evolving nature demands constant adaptation to technological advancements and shifting consumer preferences. In the framework of this study, we have examined core business models and mainly focused on marketplaces that lie on digital technologies for their development. These include:

- ✓ **Online Travel Agencies (OTAs):** These agencies are full-service providers that act as one-stop solutions for travelers.
- ✓ **Tours & Activities (T&A) Marketplaces:** Specialized platforms focusing on enhancing tourism experiences, like specific activity packages and guided tours.
- ✓ **Experience Platforms:** Platforms that offer highly customized activity recommendations with a targeted focus for more nuanced traveler categories.

Online Travel Agencies (OTAs) seem to dominate the market, offering comprehensive services while branching into related sectors like Tours & Activities (T&A) marketplaces and Experience Platforms. This branching out is indicative of how this competitive landscape drives BIMs to expand horizontally, integrating additional services for a holistic experience.

### Evaluation of Business Models in Tourism

The evaluation of business models in tourism is based on a series of criteria that affect their success and sustainability. For the proper evaluation of the above-mentioned cases, the examination of the following criteria has been conducted:

- ✓ **Revenue Model:** Revenue sources and pricing strategies.
- ✓ **Customer Acquisition and Retention:** Strategies for attracting and retaining customers.
- ✓ **Value Proposition:** The key features that differentiate the service in the market.
- ✓ **Technological Infrastructure:** The role of technology in the operation and development of the model.
- ✓ **Target Audience and Market Segment:** The focus on specific categories of travelers and needs.
- ✓ **Scalability Capabilities:** The ability to adapt and geographically expand the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- ✓ model.
- ✓ **Competitiveness and Customer Satisfaction:** Evaluation of the market position and the degree of customer satisfaction.

From the revenue model to customer satisfaction, each aspect plays a role in the overall value that a platform offers to both users and partners. The types of revenue streams, such as commissions or subscriptions, determine the financial viability, while customer acquisition channels, such as social media, contribute to attracting and retaining the customer base. Differentiating the value proposition is equally important, making services unique and competitive in a crowded market. At the same time, the technological infrastructure, which more and more includes the use of AI and Big Data, can improve the user experience and enhance the security of the platforms used by the different business models (Deliyannis et al, 2023). Targeting specific demographic groups or niche markets, adapting to local needs, geographic reach and strategic partnerships contribute to market scalability and reach. Finally, market competitiveness depends on competitive advantage, while customer satisfaction is influenced by reviews and the way the business responds to their needs. It has been mentioned that smart tourism and circular economy can drive value creation and business model innovation in tourism companies and destinations, promoting sustainability and local involvement (Del Vecchio et al, 2021).

### **Analysis results for core business models in tourism**

The conducted analysis allowed the identification of opportunities for innovation and strategic development in the tourism sector, offering valuable information for the optimization of business models and their adaptation to new technological and consumer trends. The analysis of the criteria for the examined core business models has shown the basic differences in concept and development that may affect sustainability strategies. Apart from literature review, data and information were collected from the relevant tourism platform, such as Expedia, Booking, Airbnb Experiences, GetyourGuide and Live the World. Specifically, the classification of the models was based on the type of services, the geographical scope of their services, their charged to uses. Subsequently, additional services provided were identified as well as their overlap between the examined business models. The services researched were: AI Assistance, Accommodation/travel, Itinerary planner, Ready itineraries, Simple Activity Suggestions, Tour Oriented, Local Activities, Reviews/Ratings, Smart functions (Push Notifications, Weather, Chat, etc), Discovery.

**In terms of revenue models,** Online Travel Agencies (OTAs) operate primarily on a commission basis from hotels, airlines, and other service providers. There may also be a subscription basis for premium services. Consequently, they leverage a wide range of partnerships, ensuring stable revenue streams, although they rely heavily on commissions. Tour and Activity Marketplaces (T&A MSPs) also operate on a commission basis from activity providers, with the possibility of direct sales. They may also charge listing fees for providers. Commissions are often lower than those of OTAs, but their model is more flexible, as it allows for service differentiation. Experience Recommendation Platforms often rely on advertising or sponsored partnerships with experienced providers. Direct sales or premium subscriptions for exclusive recommendations are also possible. Consequently, they have a low

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

direct revenue stream without extensive partnership networks and their model is mainly adapted to digital advertising and affiliation. In terms of customer acquisition and retention, OTAs have a strong presence in social media, SEO (Search Engine Optimization), and loyalty programs and have strong brands (identity). Recognition and prices often attract new users, but there is a significant dependence on customer loyalty. T&A MSPs rely on social networks and partnerships with influencers or travel bloggers. They often rely on local communities to retain their customers. The model is therefore focused on local content and niche audiences and is dependent on SEO and partnerships with local partners. Experience Recommendation Platforms also leverage SEO, content marketing, and a strong social media strategy for experience recommendations and reviews. The model is therefore based on curated content and personalized recommendations, but at the same time customer loyalty becomes difficult, as it often functions as an information source.

**The value proposition** of OTAs is that they offer a wide range of options at competitive prices, but they often do not differentiate themselves significantly from each other. In terms of user experience, OTAs offer user-friendly platforms with mobile applications and search tools. T&A MSPs differentiate themselves by offering unique local experiences and personalized activity packages. These platforms are usually easy to use but may have fewer options for comparing options. Experience Recommendation Platforms offer highly customized recommendations for specific audiences and personalized experiences. These are usually simple, user-friendly platforms with content aimed at personalization. As far as technology infrastructures of each model in relation to platform design, service integration, use of Artificial Intelligence (AI) and Big Data, and user security, OTAs have platforms available for mobile and desktop, while mobile applications are usually a priority. There are integrated third-party services such as flights, hotels, and rental cars. Regarding AI and Big Data, extensive use of data for recommendations and dynamic pricing is utilized. The focus on data security due to the volume of personal information is strong. T&A MSPs platforms are available for mobile and desktop, with an emphasis on mobile applications. They present less integration with third parties compared to OTAs, but more integration of local experiences. They make limited use of AI, although it can be used for customer insights and activity suggestions. Data protection is adequate, but with less complexity compared to OTAs. Experience Recommendation Platforms usually have responsive design for websites and apps. They have fewer integrations with flights and stays but collaborate with local experience providers. They use AI for personalized experience recommendations, based on preferences. Finally, they provide reliable data security, but also less reliance on personal information compared to OTAs.

In terms of **target audience and market segment** to which each case is addressed are examined, OTAs are considered more suitable for the mass market, without addressing a specific demographic. In terms of market segment, the model targets all types of travelers—economy, luxury, business. There is a low degree of personalization beyond possible loyalty programs provided. The T&A MSPs model targets new travelers and experience seekers. It focuses on local and personalized experiences for leisure travelers. In this case, there is a high degree of customization with specific local experiences. Experience Recommendation Platforms target audiences seeking personalized experiences and recommendations. The

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

model focused on niche markets with specialized offerings. Highly personalized experiences are provided, designed for individual users.

Regarding the **scalability and market reach** of the models, their geographical reach, partnerships and local adaptation have been examined. OTAs have a global reach with a local presence. They enter into numerous strategic alliances with airlines and hotels. Regarding local adaptation, they adapt well to different markets. In the case of T&A MSPs, the model is usually focused on local markets, but easily scalable. Partnerships are entered into with local businesses, hotels, and travel agencies, while regarding local adaptation, the model seems to be very well adapted to local characteristics. Finally, Experience Recommendation Platforms are often limited to specific regions or niche markets. They have fewer official partners and focus on local experiences. Effective adaptation for local culture and language is achieved.

In the **market competitiveness** section, the competitive advantages of each model and the entry barriers it raises have been examined. OTAs provide a wide selection of products and competitive prices. Entry barriers are the difficulty for new businesses due to large initial capital and strong competition. The competitive advantage of T&A MSPs lies in supporting more personalized local experiences, while entry barriers are lower compared to OTAs. Competition from large platforms is high. Experience Recommendation Platforms offer Personalized experience recommendations and personalized content. Here too, the entry barriers are quite low, but scaling internationally is difficult.

Finally, the perspective on **customer satisfaction and reviews** has been examined. In OTAs, customer ratings are usually positive for ease of use, but there are often complaints about customer service. Responses to customer comments are typical and complaint handling is often slow. In T&A MSPs, local experiences are usually highly valued, and the models are characterized by high quality of service. Also, a quick response to complaints is observed due to their smaller size. Finally, in Experience Recommendation Platforms, trust is observed in ratings for the quality of recommendations. While the response rate to user comments is usually good, as is the communication with users.

Our analysis revealed significant gaps in existing business models, particularly in the integration of AI-driven personalization, seamless multi-service integration, and localized experience curation. While many platforms excel in core travel services, holistic service ecosystems that combine AI-powered itinerary planning, real-time smart notifications, and user-generated content remain underdeveloped. Moreover, platforms tend to specialize in either accommodation/travel bookings or experience-based tourism, but few successfully bridge the gap between the two. A hybrid model that integrates both elements, leveraging AI and big data analytics to create personalized, adaptable itineraries, could offer a competitive advantage. Additionally, the importance of sustainability and eco-friendly tourism models is growing, yet remains a relatively untapped segment in the mainstream travel industry.

### Operational Criteria for User Experience (UX)

The research also focused on user experience in travel platforms as a crucial factor in their success and appeal. From booking platforms such as Online Travel Agencies (OTAs) to activity marketplaces and experience recommendation platforms, accessibility, ease of use,

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

personalization and post booking communication play a significant role in user interaction. Especially user experience and accessibility are essential for travel platforms, impacting interactivity and user satisfaction. OTAs stand out for their comprehensive experience, from seamless navigation and personalization to accessibility and post-booking communication. Activity marketplaces emphasize the easy search for experiences, offering basic accessibility features but lacking the detailed filtering options of OTAs. Experience recommendation platforms, while more limited in features, excel in simplicity and tailored content discovery. However, the absence of a booking process means they do not prioritize post-booking communication and change management. The evolution of digital platforms towards greater accessibility and user-friendliness remains critical for differentiation in the tourism services market.

The detailed criteria as analysed by the research are as follows:

|                                         | <b>OTAs</b>                                                                                                                                                        | <b>Activity Marketplaces</b>                                                                                                                   | <b>Experience Recommendation Platforms</b>                                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ease of Use</b>                      | Clear menus, step-by-step booking process (search, filters, selection, payment), strong search functions with extensive filters.                                   | Generally intuitive, though activity variety can cause confusion; simpler booking steps than OTAs; intuitive search but with fewer filters.    | Simplified navigation, no booking process, primarily recommendation-based search.                                                   |
| <b>Visual Design and Aesthetics</b>     | Professional, modern design with detailed information; responsive, but loading times may vary due to heavy data usage                                              | Visually appealing, image-driven design; mobile-friendly, though media-heavy content may impact speed                                          | Minimalistic design, emphasizing content discovery; fast loading speeds with lightweight media.                                     |
| <b>Personalization</b>                  | Personalized suggestions based on past searches and purchases; users can save destinations and options; offers extensive local adaptation (languages, currencies). | Location-based recommendations; option to save activities or tours; limited localization compared to OTAs but often supports local languages.  | Highly personalized recommendations based on interests; option to save suggestions; localized experiences reflecting local culture. |
| <b>Search Functionality and Filters</b> | Extensive filtering options (price, amenities, dates, ratings); high relevance of search results tailored to user preferences.                                     | Basic filters (dates, activity type); some specialized filters (family-friendly, eco-friendly activities); relevant but less tailored results. | Fewer filters focused on recommendations; highly personalized results based on user preferences.                                    |

## PROCEEDINGS

---

|                                |                                                                                                                                                                             |                                                                                                                                                                                             |                                                                                                                                                             |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Booking Process</b>         | Detailed process with direct payment and transparent cost presentation; flexible cancellation policies.                                                                     | Less complex than OTAs but still involves direct booking and payment; often provides cancellation policies.                                                                                 | No direct booking process; recommendations only, with no cancellation policies.                                                                             |
| <b>Trust and Reliability</b>   | Large volume of verified user reviews; secure payment processes with SSL and other trust signals.                                                                           | Reliable reviews, though fewer than OTAs; secure transactions but with fewer guarantees.                                                                                                    | Relies on user-generated reviews, focusing on authenticity rather than payment guarantees.                                                                  |
| <b>Post-Booking Experience</b> | Comprehensive communication with regular updates via email or apps; easy booking management (modifications/cancellations); often provides travel tips and loyalty programs. | Notifications about activity changes, though less frequent than OTAs; tools for booking management, sometimes requiring third-party interactions; occasional loyalty programs or discounts. | No booking management; may send emails with personalized suggestions or guides but lacks booking-related updates or loyalty programs.                       |
| <b>Accessibility</b>           | Significant investments in accessibility; compatibility with screen readers, voice commands, text magnification, and color contrast adjustments; adheres to WCAG standards. | Fewer accessibility tools but increasing compliance with WCAG standards; limited filtering for accessible activities; accessibility information depends on activity providers.              | Basic accessibility features such as text magnification and color adjustment; WCAG compliance varies; lacks detailed accessibility information and filters. |

These results suggest that Online Travel Agencies generally offer user-friendly navigation and clear booking processes with robust search and filter functions, while Activity Marketplaces and Experience Recommendation Platforms may enhance booking experiences through personalized recommendations but can differ in navigation simplicity and clarity depending on their platform design and integration of social or collaborative features. Aesthetic design principles in online travel and experience platforms can enhance user attention and engagement, influencing user behavior. In this framework platforms commonly personalize user experiences by analyzing past behavior and interests to provide tailored recommendations and adaptive interfaces, while some also incorporate localization features to further enhance customer relevance. In terms of accessibility the platforms mainly cater user needs by following Web Content Accessibility Guidelines (WCAG) standards, using tools such as accessibility evaluators and testing software to ensure compliance, but differences exist in the range and effectiveness of accessibility tools and the provision of information to users and developers.

---

### Conclusions

This study highlighted the evolutionary landscape of digital business models in the tourism sector and underscores the need for continuous adaptation to technological advancements and shifting consumer preferences. The identification of service gaps and emerging opportunities presents a roadmap for future innovation, emphasizing the role of AI-driven customization, smart functionalities, and integrated service ecosystems in shaping the next generation of tourism business models. The research showcased several benefits in the current development of business models in tourism, such as the personalization of suggestions based on user profiles, the real-time booking capability through user-friendly interfaces and the enriching experiences using tools such as digital guides, VR/AR and live updates. On the other hand, several gaps have been identified such as the lack of comprehensive information for unorganized activities or small providers, limited use of predictive analytics to predict traveler needs and reduced connection between different platforms for a holistic user experience.

Based on the above, the following steps of the research include the drafting of improvement strategies, focused on sustainable tourism management, such as the development of unified platforms that connect and integrate information from OTAs, Tour Marketplaces and Experience Platforms, the application of machine learning models to predict traveler needs based on historical data and preferences and the use of performance indicators to measure traveler satisfaction. The results of the research showed that the existing business models provide strong bases, however, they show room for improvement through the use of advanced technologies. The INDIANA project can contribute substantially to bridging the gaps identified, promoting personalization and enhancing the traveler's experience.

[akouveli@arch.duth.gr](mailto:akouveli@arch.duth.gr)

#### Abstract

Tobacco and tobacco warehouses hold a significant place in Greece's history, particularly in the Region of Eastern Macedonia and Thrace. The area is renowned for cultivating Oriental Tobacco, which is officially recognized on Greece's National Inventory of Intangible Cultural Heritage (No. 52| 2020). Beyond its historic and cultural value, this legacy is reflected in the region's architectural heritage, with numerous tobacco-related structures still prominently integrated into the urban fabric today.

The present paper examines the role of tobacco warehouses in Kavala, a city in Eastern Macedonia and Thrace, in fostering sustainable urban growth and preserving cultural heritage. Once a prominent tobacco hub, Kavala's historical identity is closely tied to the tobacco industry. Today, these heritage buildings, which were once vital to the city's economy, are now envisioned as key assets for revitalizing local communities through adaptive reuse.

By analyzing the architectural, social and economic significance of tobacco structures, the research highlights their potential to drive sustainable urban growth, enhance tourism, strengthen social cohesion and safeguard cultural heritage, thereby contributing to the city's ongoing transformation. Repurposing the warehouses can create a link between Kavala's rich past and its future, blending history with modern sustainable principles. This transformation can enhance community engagement, promote tourism and create eco – friendly business opportunities. As iconic landmarks of adaptive resilience, tobacco buildings serve as vital assets in addressing contemporary urban challenges, while maintaining a balance between tradition and innovation.

**Key words:** Tobacco warehouses, Kavala, Sustainable Growth, Cultural Heritage, Socio-economic impact.

#### Abstract

The increasing adoption of remote work is reshaping how we approach urban planning, residential living, and workplace design. This paper delves into the implications of remote work on urban infrastructures, highlighting the need to adapt planning policies to this evolving trend. By addressing residential land use, transportation, energy, and workspace design, the study aims to provide actionable insights for urban planners, architects, and policymakers.

Remote work's influence extends to residential preferences, with mixed-use communities offering local amenities becoming increasingly desirable. Reduced reliance on proximity to workplaces may drive demand for suburban and rural housing, emphasizing the need for more spacious and affordable homes. This shift calls for a reevaluation of urban planning norms (e.g., the European standard of 40 m<sup>2</sup>/person) to accommodate home offices and home outdoor workspaces (e.g., on balconies). Additionally, the increase in home energy consumption calls for enhancements to internet infrastructure and a potential need to shift towards renewable energy sources.

Transportation planning may also shift, with cities prioritising walkability, biking, and public transport over car-centric plans. Workplaces, meanwhile, are evolving toward more flexible models, including smaller satellite offices, coworking spaces, and hybrid setups. These spaces not only reduce operational costs for businesses but also cater to the needs of remote workers by offering shared amenities, flexible leasing, and opportunities for community engagement.

This study, funded by the European Union Horizon Europe project R-Map (GA101132497), began in February 2024 and is currently grounded in a comprehensive literature review. Preliminary findings will be supplemented by ongoing research and first-hand insights to be presented at the 2nd OPEN-AIR CITIES International Conference in February 2025.

#### Abstract

This paper's goal is to analyse the potential of distributed urban production to lead to regenerative and circular city development in Thessaloniki, by engaging urban and spatial analysis tools, and by building upon the results of the EU Horizon2020 Pop-Machina project (Grant Agreement n. 821479). Pop-Machina grasps the opportunity to nurture the bottom-up development of maker communities and supports them to create new, circular and marketable products collaboratively. This is expected to stimulate urban innovation, reshape the urban productive system, and result in new job creation and the enhancement of the urban regeneration potential of the city.

To this end, this paper (i) provides an overview of the regulatory and strategic context in which the city operates; and (ii) applies an innovative methodology to identify the characteristics of its urban maker ecosystem and the urban assets that may be leveraged as sources of strength for a more circular and regenerative urban production ecosystem. The results of this spatially based investigation of the cultural, socio-economic, regulatory, and

---

technological characteristics of the maker community ecosystem of Thessaloniki provide insights for local, national and EU-level policy recommendations towards optimising distributed urban production for a circular and regenerative development.

More specifically, the study's findings offer insights into the city's metabolism and can inform urban planning and design decisions to embed circular and regenerative measures effectively. They contribute to the development of recommendations for specific types of maker activities and maker infrastructure that should be developed, resonant with the city's making profile, and needs identified in specific neighbourhoods. Last, the paper proposes changes that need to be made across scales to open new pathways for the maker movement's contribution to urban circularity and regeneration.

### **SERVICE DESIGN IN URBAN LIFE: PROPOSING A CO-DESIGN MODEL FOR INTERVENTIONS IN URBAN COMMONS**

**Chairetakis Dimitrios**

*Graduate, University of the Aegean, Department of Products & Systems Design Engineering,  
[chairetakis.d@gmail.com](mailto:chairetakis.d@gmail.com)*

#### **Abstract**

Urban commoning refers to making alternative spaces and relationships amongst local actors, and it is strongly dependent on local community and government. Design has been extensively utilized in the process of identifying, maintaining, or altering commons. However, challenges such as limited adaptability of the local government, local culture that does not facilitate participation, lack of infrastructure, and skepticism towards new methods hinder the development of experiments for a more extensive exploration. Design shows potential for greater impact, if it addresses the commons within a more strategic framework.

This thesis examines the relationship of service design with the urban reality, in search of frameworks through which the latter can be redefined, as we attempt to transition to more sustainable futures. Following a literature review, analyzing first of all the meaning of urban commons, then reviewing approaches not in the design field, the author identifies the characteristics which define design as the most relevant framework through which we can manage today's urban complexity. This has a goal of contributing to a more fluid social regulation in regards to urban matters, while building infrastructure and tools to support the aforementioned transition. It is deemed most suitable for design activity to occur in the organizational, or meso-level of the system. As a result of that, a model for managing design interventions of urban commons is presented, to be used by a multitude of organizations and actors, enabling parallel interventions towards one common. This model is strongly inspired by co-design, service design, urban commoning, and futuring methodologies.

**Keywords:**Service Design, Co-Design, Urban Commons

## Abstract

The urban landscape of Athens, characterized by a complex interplay of metropolitan experiences, cultural layers, diverse encounters, historical memory, social transformations, and aesthetic impulses, serves as a focal point for observation. Urban observatories have been established in various locations, including Ymittos, Omonia Square, Kifissias Avenue, the electric railway lines, Alexandra's Avenue refugee camps, Kerameikos, and the dwarfs of Petroupolis, among others. These small-scale architectural interventions propose supervisory trails and pathways, curate Athenian imagery, and function as sites for reflection on the urban imaginary for residents and visitors. Experimental and alternative structures populate the urban public space, transcending the mundane and repetitive nature of busy urban areas. These structures, whether viewed from above, in close proximity, or from a distance, engage with the city and contribute to its mythology through the introduction of new spatial narratives and representations. By fostering embodied presence, they expand the domain of visual culture, facilitating the recollection of monuments and guiding physical contemplation, particularly in relation to emerging technologies. Furthermore, they establish prototypical models for interpreting the materiality of urban spaces, unearthing forgotten fragments of the city's discontinuous, ambiguous, and indistinct identity, while revisiting the memory of historical events and socio-political ceremonies.

The graduate student designs of architectural structures, aimed at observing urban life and public spaces, present unique chronotope narratives of Athens' urban character. This city is marked by diversity, contradiction, and unpredictability, where its historical essence, mythological roots, and archaeological landmarks converge with its contemporary, fluid, and chaotic identity. These designs provide both analogue and digital panoramas that explore historical and cultural, geographical and urban, as well as anthropological and psychographic attributes and variances. They seek to decode the random, the quotidian, and the familiar aspects of urban life and identity.

**Key words:** Spatial narratives, urban observatories, supervision, architectural design, public space, architectural panoramas, memory.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### Introduction

The urban landscape of Athens, a tapestry of metropolitan experiences, cultural deposits (Eco, 1998), multifaceted encounters, historical memory, social transformations, and aesthetic impulses, becomes a subject of observation. In Ymittos mountain and Omonia Square, above Kifissias Avenue and over the tracks of the electric railway, alongside the refugee camps on Alexandra Avenue, at Zappeion or Kerameikos, and in the neighbourhoods of Petroupolis and beyond, urban observatories are established. These small-scale architectural constructions propose curated view sequences and pathways, collect Athenian imagery, and serve as fields for reflecting the urban imagination, inviting the experiential involvement of both residents and visitors. Experimental and alternative structures populate the urban public space, rising above the mundane and repetitive. They are inscribed in bustling urban areas, in squares where human flows are dense or in the peace and tranquillity of the mountains. From above, up close, or from a distance, they ‘look at’ the city and enrich its mythology with new spatial narratives and representations. Through embodied presence, they expand the realm of visual culture, aiding in the recollection of monuments and guiding physical contemplation, particularly in relation to new technologies.

This paper explores how spatial narratives shape cultural heritage, the role of urban observatories in contemporary city planning, and the interweaving between public space and architectural design. Observatories create interpretive frameworks to interpret the ‘materiality’ (tangible or intangible) of urban spaces, seeking out forgotten fragments and ‘deposits’ of their discontinuous, vague, and indistinct physiognomy while evoking memories of historical events and socio-political achievements. The students’ proposals for the design of architectural structures, which involve targeted observations of city life and outdoor public space, constitute unique narratives of the urbanity of Athens. A city that is diverse, contradictory, and unexpected, where its historical character, mythological origins, and archaeological monuments intertwine and intersect with its current porous and chaotic image.

Organizational architectural thinking, through analytical and compositional processes, seeks to provide form and a tangible shape to the concept of the observatory as a cultural intervention within the urban landscape - urbanspace. The observatories captured in the student studies connect the architectural shell with human practices. They offer both analogue and digital panoramas that explore historical, cultural, geographical, urban, anthropological, and psychographic qualities and diversities. These panoramas manifest and embellish the random, the everyday, and the familiar. They evoke dominant fantasies, obsessions and desires of citizens, intertwining distinct urbanities of the metropolis. They approach the distinct urban experiences and the connotations of urban life and identity, revealing “the spirit that emerges from the places”, as Pikionis (1987) states.

### Looking at the city “again”

“The knowledge of cities is linked to the deciphering of their dreamlike, expressive images”  
(Kracauer, 1931)

“The city shifts over time, it’s not a fixed image.  
It defines itself through contrasts, it yearns to explode.”  
(Wenders, 1988: 37)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The captivating character of multifocal, multifaceted and historically rich cities, such as Athens, arises from the concentration of diverse elements and overlapping layers. The amalgamation of infrastructure, buildings, antiquities, monuments, landmarks, urban myths, micro-histories, collective narratives, spatial snapshots, and sensory stimuli creates a heterogeneous tapestry that underscores the city's historical trajectory and reveals its spatiotemporal depth. The unique essence of Athenian city is synthesized through the interplay of reality and myth, the present and the past, as well as memory and history by means of apparent or hidden cultural and collective deposits (Moirá, Makris, 2024a).

The observatory, both as a structure and as a vantage point, positions the viewing body at a specific location in space, allowing for meaningful interaction with the environment. It fosters a context rich in significance, as observing the world constitutes a revelation and manifests its essence, facilitating a negotiation and decoding of the elements that comprise its totality. The image of the place is not merely a reflection or a simple mirroring of its form on the observer's retina. The image of the place is not merely a passive contemplation; rather, it involves an understanding of its secret, invisible, and enigmatic laws and entities. In experiential perception, the view of a place can evoke memories, provide enlightening in terms of the factual information, elicit sensitivity and excitement. This occurs when the researcher-architect successfully identifies new and significant formal, syntactic, and structural relationships, and to devise the means by which to render the character of the landscape or the observed object, including its invisible aspects (Moirá et al, 2024b: 152-158).

The perception of a city's image, the contemplation of its urban form, the observation of its bustling and complex nature, and the immersion in its cultural content are the focal points of study for the urban observatory. The observatory aims to establish a new reference point for the city. It challenges stereotypes and reflects on the evolving condition of habitation and residence in Athens, as well as the renegotiation of the familiar and the unfamiliar. Its goal extends beyond mere observation; it aims to stimulate vision and provide an experience that uncovers the indistinct and overlooked urban character that is often obscured by the hurried and superficial perceptions of daily life. The conception of observatory's form and function depends on the context in which it is integrated, the architectural design that serves its functional needs by defining relationships and activities, and, most importantly, the narrative focus and the type of surveillance experience it aims to ensure. At times the proposed view is strictly defined to guide the gaze in a single direction and shaping the viewing angle and cone of vision, or to turn sequentially and selectively in more directions, orienting the viewer's gaze to the wider urban landscape. Subjective experience and observation, which are proposed, can also be peripatetic, evolving through space and time, organizing a specific path from one point to another or serves a process of wandering in multiple directions, depending on the impression the observatory wants to create.

In this scenario, the viewer engages with a sequence of images by manipulating the heterogeneities, scale, metric relationships, and proportions that constitute the syntactic structure in space. Walking observation enhances the experience through selected, fragmentary, and discrete images of the city, or through a continuous sequence that evokes a cinematic quality in the viewing process. In this manner, a condition is established in which the body and movements of the subject are in constant interaction with the environment. The world and the self continuously shape and redefine one another. The perception of the body

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

and the image of the world are transformed into a singular and continuous existential experience. There is no space that is not connected to the unconscious image of the perceived self, (Pallasmaa, 2022: 96-97).

Siegfried Kracauer (1995) writes of the “experience of the city as a labyrinth of fragmented signals”. In his article ‘Strassen in Berlin und anderswo’ he makes a clear distinction between images of the city. He writes: “One can distinguish between two types of cityscape: those which are consciously fashioned and those which come about unintentionally. The former spring from the artistic will which is realized in those squares, vistas, building ensembles and perspectives which Baedeker generally sees fit to highlight with a star. In contrast, the latter come into being without prior plan.” (Kracauer, 1964: 40). Therefore, the architectural design of each urban observatory has the potential to shape, control, submit or even impose specific observational conditions, thereby revealing intriguing perspectives of the urban landscape and its timeless political and cultural evolution. In the observatory, the gaze is directed to penetrate cracks, skylights, and openings. This approach aims to unveil enigmatic and imperceptible images—what Kracauer refers to as the grey images of the city. These images, being indistinguishable and illegible, are often overlooked and bypassed by the observer.

The experience of the observer is guided by the spatial design of the observatory, as users follow directional cues within the environment of the design proposal. This interaction can be self-directed, allowing individuals to navigate selectively through space or adhere to specific instructions, such as walking, standing, sitting, or lying down. The observer's gaze can encompass the urban landscape in a full 360 degrees, akin to a periscope, enabling a comprehensive view of the city or focusing on particular segments of the urban panorama. They can examine the space from various perspectives—top to bottom, inside to outside, or from ground level to the sky—immersing themselves in a multi-sensory experience that integrates the urban landscape with their own perception or their virtual integration.

De Certeau (1984) argues that spatial narratives are constructed through the everyday actions of individuals navigating urban landscapes. This perspective reframes public spaces not merely as architecturally designed zones, but as lived arenas of micro-resistance and adaptation. Thus, cultural heritage must be understood not only as a static historical artifact but as a dynamic, evolving spatial text. With the introduction of the distinction “voyeurs or walkers”, Michel de Certeau introduces the distinction between two distinct categories of urban imagery. On one hand, there are the panoramic views that observe the city from above, providing a distant perspective that offers the viewer an urban panorama—a representation of the city-map from a vantage point. These images engage in myth-making, transforming the intricate fabric of the city into a visual artifact and positioning us, the viewers, as voyeurs. On the other hand, urban observatories are being invented that symbolically or tangibly engage the observer with the life of the city, including the flow of cars and trains, as well as the daily movements and activities of its ordinary users. At the height of this gaze, diverge images emerge that are often unreadable and hermetic, encapsulating the dark and poetic spatiality of the inhabited city. This city is shaped by fragments of urban imagery, each containing echoes of the past, leaving it to the observer to synthesize these elements and form their own interpretations of the unstable, chaotic, and fluid nature of the contemporary city, characterized by multiple fragmentary signs. Not merely the singular, normalized image of a

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

postcard city, but rather its facets that remain unseen due to habit and saturation. This palimpsest of subjective experience illuminates the tensions, densities, discontinuities, ruptures, and intersections within the urban continuum, revealing the invisible nuggets of urban, political, historical, and social culture that define cities.

The urban landscape, as noted by Moraitis, “is the quintessential public place whose configurations reflect, throughout the entire range of our known urban history, the different expressions of the cultural and political identity of societies” (Moraitis, 2024: 311). In this context, student studies of urban observatories are designed to serve as focal points of public reference. This approach allows for urban porosity—a concept introduced by Walter Benjamin and Asia Lacis (1925) in relation to Naples—where new cultural associations can emerge. These associations have the potential to enhance the public character of the city, facilitate the networking of places, promote the exchange of ideas, and ultimately contribute to the formation of the Athens’ cultural landscape.

### **Choosing the location, the design, and the narrative of the urban experience**

“The worth of cities is determined by the number of places in them devoted to improvisation.”  
(Kracauer, 1964:50)

Architecture, when it seeks a simultaneous and unified understanding of place and action, possesses a performative character, as noted by Kotionis. Architecture includes within its jurisdiction the very organization of life itself, encompassing all actions and achievements that enable individuals to inhabit their familiar spaces, while integrating both the visual and performing arts. “It is not a matter of first establishing the place and then introducing an action within it; rather, there exists an interaction that co-constitutes both the content and dynamics of the place” (Kotionis, 2024: 690). Athens, as described by the artist Sevastakis, is “a fragile city.” He notes that “the violent urbanization multiplied, to the point of suffocation, both in terms of area and height, the built environment and adopted a harsh construction language with absolute geometry, which rather contradicted the great encroaching and structural anarchy that enveloped the city of hasty and unstable habitation. In the traces of fluid installations, the modern city was erected in a very short time” (Sevastakis, 2024:140). A disguise of irregularity and improvisation did not lead to aesthetic, structural, class, or cultural formations; rather, it resulted in a simplistic interpretation of modernist ideals and the deductive logic of the Athenian apartment building. The urban observatories designed by the students are intrinsically connected to the cultural, socio-political, and environmental characteristics of the urban landscape. They aim to transcend the overt elements of the image and uncover the hidden identifying features of Athens. The urban observatories designed by the students reflect an effort to understand the city of Athens as a broader, multidimensional, and complex spatial and cultural imprint on the natural environment.

De Certeau noted: “Places are fragmentary and inward-turning histories, pasts that others are not allowed to read, accumulated times that can be unfolded but like stories held in reserve, remaining in an enigmatic state, (...) there is no place that is not haunted by many different spirits hidden there in silence, spirits one can “invoke” or not (De Certeau, 1984: 108). The studies focus on significant geographical landmarks, enigmatic points of tension, and areas of historical and social densification, such as historic squares, allowing observers to

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

perceive the city “again” and in new ways. The proposed urban observatories unveil their chaotic complexity and enigmatic allure and always mutating forms. According to Ingold, (2000: 188) “building is a process that goes on as long as people live in an environment. It does not start with a plan we have conceived in advance and ends with a ready-made object. The ‘final form’ is only fleeting.” Both the built and the natural landscapes are elucidated and unveiled through the interconnection of diverse objects and subjects that engage with its environment. In the current framework, the exploration of the depth of matter-form relations in urban landscape contemplation examines how spatial narratives and perception models influence the understanding of urban environments. Research in this field often examines how anthropogenic imprints, or traces of human activity, manifest in architectural spaces and how they contribute to collective memory (Schulz, 1980). Emerging methodologies, such as digital reconstructions, participatory urbanism, and sensory mapping, help analyse how past human activity leaves enduring marks in architecture. These inquiries often utilize experimental perception models to explore urban transformation, historical layering, and spatial interpretation. (Picon, 2018). Many studies address the visibility of historical and material traces in contemporary settings, offering insights into how cities encode past narratives within evolving landscapes (Anderson, 2015).

Urban observatories are situated at the city's periphery, along the boundaries of the natural landscape, or within its historical centre—areas characterized by a rich presence of cultural deposits, archaeological resources, and social interactions. These observatories play a vital role in emphasizing and critically analysing the city's cultural identity. In terms of form and structural composition, these constructions can be categorized as either small-scale enclosed structures—such as capsules and uniquely designed shells—or as open installations that are still in development. The latter feature an aesthetic appeal and provide free access, functioning as balconies, platforms, scaffolding, or towers.

Ymittos one of the four mountains which delineates the boundary of Athens' basin, rivals Athens' natural observatories, Lycabettus and the Acropolis hill, as a prime location. It is selected as an ideal site for proposed observatories that capture distant panoramas, situating Athens within the broader context of the Attica region and the Saronic Sea, thereby providing geographical insights. The proposed observation installations, simultaneously, evoke a sense of secret and hidden shelters within the mountain's body, which manage the past and the present, through new architectural structures or structures for the regeneration of dilapidated buildings. The observatory, which appears to precariously perch on the mountain's edge, evokes the notion of a refuge—a sanctuary equipped with openings for surveillance that provide selective views of the city. At night, a light fixture embedded in the ceiling emits bright signals into the sky.

---

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

For instance, the stone tower of Anthousa, ancient beacon tower (fryktoria), is resurrected from obscurity with a slightly perforated metallic structure that frames and accentuates it, allowing visitors to navigate safely alongside and around it while enjoying the surrounding natural and urban landscapes. The observatories are designed interventions that facilitate the revelation of landscapes through interaction. The regenerating ruins attract attention and draw people to specific, perhaps underutilized or transitional areas, creating new focal points for interaction and the emergence of unexpected cultural associations, thereby facilitating the networking of places. The Anthousa project is exemplary, the new metallic structure actively interacts with the historical trace (the fryktoria), not erasing it but framing and allowing navigation around it, revealing its presence and context within the surrounding natural and urban landscape through this designed encounter.

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

On the opposite end of the city, the observatory has selected the Petroupolis Dam as its site for integration, provides a stunning view of the city, Ymittos, and the moon rising behind it from a disc that has landed on the mountain. This inclined circular platform offers visitors a captivating perspective of the cityscape against the backdrop of a starry night sky. The Petroupoli observatories explicitly contrast the natural landscape with the urban sprawl, allowing the observer to physically inhabit this boundary. using design to amplify this location as a topos of maximum tension. The design (e.g., the disc seeming to 'land' from the sky) accentuates this juxtaposition.

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

Other observatories are strategically installed at central, emblematic locations throughout the city, including intersections, squares, pedestrian bridges, and above electric lines overseeing the city's traffic, publicity and cultural landscape. They serve as poetic multisensorial allegories for the continuous flow of people and transportation, highlighting the impassable roadways and the relationships between the city's disparate spaces. These observatories represent cross-sections, interstices, and intermediate zones suspended in the void. They oversee transitions and passages of the crowd, transforming the familiar, everyday practices of citizens into a transient ritual—such as safely crossing from one side of the city to the other—while fostering a new perception of urban time and space.

The first observatory above Kifissias Avenue is a sculptural installation composed of dense, discontinuous tubes resembling a construction site or an unfinished structure. This design creates an enclosed, permeable structure that appears to float in the void, extending transversely toward the pedestrian bridge and heightening the unsettling, unfamiliar sense of ‘danger’ above the river of cars below, to provoke awareness of the infrastructure's scale/speed. The physical sensation of being suspended above traffic in the Kifissias structure profoundly shapes the perception of that space through bodily vulnerability.

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

In contrast, the second observatory situated above the train lines takes the shape of a tunnel formed by identical frames aligned parallel to the pedestrian bridge. This structure includes two enclosed balconies that provide views of the trains moving in opposite directions. the openings in the Kifissias or the structure near the train lines wouldn't just offer panoramic

---

views but deliberately fragmented glimpses of the underlying chaos of traffic or the repetitive motion of trains, revealing the "unconsciously fashioned" cityscape Kracauer (1995) contrasted with monumental planning.

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

Omonia Square, the second most recognizable historic square in Athens after Syntagma Square, serves as a significant urban focal point. It is a place that is both central and marginal, timeless yet ephemeral, changeable yet stable and unchanging over time. The observatory, located in Omonia Square, extends like a pathway that branches out in a triangular arrangement, developing in a staggered manner in height with ramps and corridors. This design provides an unobstructed view of the Acropolis, the iconic neoclassical buildings—including the historic Bagion and Alexandros hotels, which serve as informal gateways to the traditional city, as well as the Neon Cafe—and the surrounding roadways. The structure primarily consists of iron, featuring overlapping glass surfaces and complementary radial luminous prismatic elements along its perimeter. The observatory re-manages and reinterprets the concepts of memory (as exemplified by the Zongolopoulos fountain and the Varotsos sculpture ‘Runner’), multiculturalism - reflecting the enduring presence of internal migrants and refugees at the edges of the square and at the metro exits. It also refers to the centripetal dynamics of urban syntax, specifically the avenues that converge at the centre. The Omonia observatory is placed within a square embodying contrast (Wenders, 1988) (central/marginal, historical/contemporary, grandeur/neglect). Its design, with branching paths and varying heights, likely forces encounter with these conflicting elements – the view towards the Acropolis juxtaposed with the immediate reality of the square's complex social dynamics. The square serves as a hub and crossroads, acting as both a starting point and a point of convergence for various historical periods and cultural characteristics. The Omonia observatory, while offering grand views, likely incorporates moments where ramps or corridors frame narrow, specific sightlines towards neoclassical details or the mundane activity at street level, forcing a focused gaze that decodes these less obvious, "dreamlike" elements Kracauer (1931) spoke of. The act of walking, climbing, and turning, choreographed by its architectural design, becomes integral to the observational experience, aligning with Pallasmaa's focus on embodied, existential perception (Pallasmaa, 2012).

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

An observatory, which is part of Kerameikos, is located at the intersection of Ermou Street and Piraeus Street. It aims to become a metaphorically panoptic, tree-shaped tower designed as a bisected square, serving as a new urban epicentre for the city. Rising at the streets’ intersection, it resembles a luminous screen-eye that observes its surroundings while simultaneously collecting and displaying images of crowd movement on digital screens. Thus, it functions not only as an observatory for the wider area but also as a transmitter and receiver of digital images.

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The Kerameikos tower offers both the potential elevated (“voyeur”) view and the ground-level digital screen reflecting the “walker's” domain (the crowd), creating a complex dialogue between the two modes. This observatory is interconnected with another identical observatory which is proposed for construction in Shibuya, Japan. The two twin observatories will relay a continuous stream of real-time snapshots from their respective urban environments and vice versa. The Kerameikos “screen-eye” directly materializes Kracauer's (1995) “labyrinth of fragmented signals” by not only observing but collecting and displaying digital snapshots of crowd movement, transforming the ephemeral flow into a tangible, albeit fragmented, representation of urban life.

Finally, the observation scaffolding that is suspended and parasitizes next to the refugee buildings in Alexandras Avenue serves as a cultural intervention. It references the ongoing management of the historical significance of the iconic modernist structures and the role they played in accommodating the refugee influx following the Asia Minor Catastrophe. The buildings, inaugurated at the beginning of the 20th century, serve as a historic and emblematic example of social housing, architectural design, and urban planning, reflecting the principles and values of modernism. Simultaneously, they represent a site of exclusion and degradation. Situated along a road axis of major urban thoroughfare with significant traffic, these structures are at the heart of a diverse urban environment. They are adjacent to high-intensity public facilities, including a football stadium, hospital complexes, metro stations, police headquarters, and courts (Areios Pagos). Additionally, the surrounding area features a variety of shops, cinemas, theatres, and restaurants. The observatory seeks to evoke the collective memory embedded in the space, the buildings, the cultural activities, and the enduring aspirations of its inhabitants. The design features a symbolic upward trajectory, incorporating ramps that allow for the observation of the surrounding area from high up on the rooftops of the buildings. The Alexandra Ave ramps offering views from the rooftops allow observation of the surrounding urban fabric – often messy and unplanned – from an unusual perspective, unveiling the “indistinct” character often obscured by ground-level perception. At the same time, it includes a screen that displays scenes from the city's past and anticipated future, literally and figuratively projecting images such as photographs from the significant demonstration in December 2008, films, and contemporary artistic actions and installations.

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

---

The observation structure within the Zappeion Park holds significant symbolic value, representing the timeless emblematic promenade of Athenian citizens throughout the history of the Greek state, as documented in literary, visual, and historical records. Additionally, it serves as a destination for visitors, as the area offers a privileged view of the Parthenon is a tourist destination, as it is an integral part of the broader archaeological and cultural landscape. The observatory proposes a parallel route to the open outdoor space of the Zappeion through a playful and clearly defined passage. A curved structure, resembling an arch, composed of superimposed parametric frames creates a threshold, a passage through space like the 19<sup>th</sup>-century arcades. It is designed to impose its own rhythm on movement, placing particular emphasis on the entry and exit of the spectator-visitor. This creates a symbolic urban arcade, but devoid of a commercial character, allowing visitors to traverse the Zappeion's space without distractions while enjoying the interplay of fragmented city images turning the act of passage itself into a “hybrid ritual” of perception, a modern, non-commercial flânerie. This unique tunnel facilitates contemplation and signifies the beginning and end of a journey-experience in both space and time.

Cases from student designs. ‘Spatial Narratives’ Studio, Spring 2024

### **Conclusions: synthesizing the role of Athenian urban observatories**

“The same town, when looked at from different places, appears quite different and is, as it were, multiplied in perspectives.”  
(von Leibniz, 2014: 25)

The exploration of urban observatories in Athen’s landscape, as conceptualized through the described student proposals, presents a compelling argument for the value of targeted, architecturally defined interventions in fostering new modes of urban perception and understanding. The architectural form enables and directs the action of observation, making the place (the observatory structure) and the action (gazing, reflecting, moving) inseparable, co-constituting the unique experience. The core contribution lies in positioning these observatories not merely as passive vantage points, but as active interpretive engines embedded within the city's complex fabric—structures that do not merely observe but actively participate in shaping urban experience. This study has highlighted how architectural design, spatial narratives, and participatory methodologies can transform urban observatories from static observational platforms into dynamic, spatialized forms of urban knowledge production. These observatories do not just document the city of Athens; they mediate, reveal, and

---

reframe it—challenging dominant urban discourses and fostering new spatial imaginaries that are rooted in lived experience, memory, and engagement. The following are the key analytical insights. *Mediating Complexity.* The projects successfully grapple with Athens’ defining characteristic: its layered, often contradictory nature – a palimpsest of history, myth, modernity, crisis, and everyday life. The observatories act as mediating devices, offering focused lenses (both literal and metaphorical) through which this complexity can be navigated and comprehended, rather than being overwhelming or ignored. *Beyond the Visual.* While inherently tied to the act of “gazing,” the more potent proposals described implicitly push beyond mere visual consumption. Concepts like peripatetic observation, multi-sensory engagement (implied through presence in diverse environments), and the evocation of memory and narrative suggest a move towards a more phenomenological and embodied understanding of urban space, aligning with thinkers like Pallasmaa. *Narrative Construction.* The observatories are framed as generators of novel spatiotemporal narratives and representations. This highlights their potential role in cultural production, actively shaping the city’s evolving identity and mythology, challenging dominant or stagnant narratives (e.g., the purely classical vs. the solely chaotic). They function as potential sites for contesting and re-inscribing meaning, as suggested by De Certeau’s distinction between the strategic view from above and the tactical paths from within. *Critical Engagement.* Several proposals (e.g., Kifissias Ave, Alexandra Ave refugees’ buildings, Omonia square) demonstrate a capacity for critical engagement with the urban condition – addressing infrastructure’s dominance, historical memory and trauma, social marginalization, and the dynamics of central public spaces. They aim to make visible the often “indistinct and overlooked,” echoing Kracauer’s interest in the city’s less obvious, yet revealing, facets. *Architectural Agency.* The analysis underscores that the architectural form itself is not neutral. The design choices – framing, enclosure, materiality, pathway sequencing, height, orientation – are presented as deliberate tools for shaping experience, directing attention, and provoking specific reflections or emotional responses. This affirms architecture’s performative capacity, as noted by Kotionis, in organizing not just space but also perception and interaction.

## Epilogue

The observatories scattered across Athens serve as unique venues for site-specific art, transforming unconventional locations such as overpasses, mountainsides, repurposed structures, and central urban squares into immersive spaces for artistic expression. These settings provide context-rich backdrops for installations, performances, and experimental happenings, engaging directly with the surrounding environment and its layered narratives. Furthermore, the observatories, with their meticulously framed views, architectural compositions, and striking juxtapositions of urban elements, inspire artists—including photographers, filmmakers, writers, painters, and musicians—encouraging the creation of new works that capture the visual and spatial essence of the city. As a result, these structures serve as catalysts for the reinterpretation of Athenian landscapes. At the same time, these sites function as platforms for dialogue and debate. Positioned in socially or historically significant locations such as Omonia and Alexandra Avenue, they serve as focal points for public discussions, workshops, and cultural events addressing pressing urban issues, social memory,

---

migration, and development. Through curated programming, they foster civic engagement and collective reflection on the evolving urban landscape.

Embracing contemporary digital culture, these observatories have the potential to integrate interactive technologies, incorporating digital screens, augmented reality (AR) choices, and locative media projects. This convergence of physical and digital realms allows for dynamic explorations of urban narratives, data visualizations about the city, and the presentation of digital art, bridging past and present through immersive, technology-driven experiences.

Their visual presence within the cityscape also positions them as emerging cultural nodes. Beyond their primary function, they become informal landmarks, generating movement and interaction while anchoring small-scale cultural activities, spontaneous gatherings, and social exchanges. In doing so, they redefine public space and contribute to a more vibrant, participatory urban experience. In parallel, these structures play a critical role in re-contextualizing heritage. By framing specific viewpoints, they juxtapose iconic landmarks—such as the Acropolis seen from Zappeion or Ymittos—with contemporary urban realities, infrastructure, and overlooked historical layers. This perspective fosters a dynamic understanding of heritage, emphasizing its continuity and transformation rather than a static, monumentalized past.

Moreover, they shed light on often-overlooked or intangible aspects of heritage. Directing attention to industrial archaeology, modernist social housing, the evolving social history of public squares, or ancient infrastructure traces, they make the invisible deposits tangible. These interventions challenge conventional heritage narratives, revealing the layered complexity of Athens' urban fabric. Crucially, these observatories introduce an experiential mode of heritage interpretation. Rather than relying solely on informational panels, they invite visitors to engage physically—climbing, looking through apertures, or navigating curated pathways—transforming perception into an embodied experience that deepens historical and spatial understanding.

By acting as storytelling devices, they empower artists, and community groups to construct narratives that weave together different historical periods, sites, and social experiences. This narrative-driven approach makes heritage more accessible, engaging, and relevant to contemporary audiences. These observatories encourage a critical engagement with heritage. Rather than promoting passive consumption, they invite reflection on issues of preservation, representation, power dynamics, and the role of heritage in contemporary urban life. Through this lens, visitors are prompted to question and reinterpret the built environment around them.

Ultimately, Athenian observatories act as cultural acupuncture points, directing focused attention to specific locations to stimulate broader awareness, artistic response, and a more nuanced appreciation of both contemporary culture and the city's richly layered history. By fostering dialogue, creativity, and re-interpretation, they offer a proactive means of engaging with Athens' identity, interweaving its past, present, and future into an evolving urban narrative.

# STRATEGIC STAKEHOLDER ENGAGEMENT FOR LONG-TERM SUSTAINABILITY OF URBAN DEVELOPMENT PROJECTS

**Zacharis Theo**

*Innovation & Strategy Advisor, Greek Scientists Society*

[theo@greek-scientists-society.org](mailto:theo@greek-scientists-society.org)

## Abstract

Sustainability in urban development requires a multi-faceted approach to stakeholder engagement and long-term project planning. This presentation explores the critical role of stakeholder analysis in ensuring the success and continuity of urban development initiatives, focusing on sustainability outcomes beyond the initial four years of project implementation.

The research identifies key stakeholder groups across the quadruple helix model—government, industry, academia, and civil society—and evaluates their impact on project sustainability. Through a comparative analysis of case studies from European cities, the presentation highlights effective strategies for collaboration, resource mobilisation, and policy alignment. These strategies have been shown to enhance project outcomes and address environmental, economic, social, and cultural dimensions of urban sustainability.

This presentation emphasises the need for dynamic stakeholder frameworks that adapt to evolving urban challenges, ensuring inclusive participation and long-term project viability. It provides actionable insights into integrating stakeholder analysis into urban planning processes, contributing to the realisation of Sustainable Development Goals (SDGs), including Goal 11 (Sustainable Cities and Communities) and Goal 17 (Partnerships for the Goals).

This work aims to underscore the importance of sustainability planning that extends beyond the initial project phase, offering tools and methodologies for urban developers and policymakers to design resilient and inclusive cities.

**Key words:** Stakeholder analysis, sustainability, urban development, quadruple helix, project lifecycle, SDGs

## **EXPLORING PUBLIC PERCEPTIONS OF THE PARIS 2024 OLYMPICS' SUSTAINABILITY STRATEGY: A CONTENT ANALYSIS OF COMMENTS ON YOUTUBE VIDEOS**

### **Abstract**

Mega-events like the Olympics are notable for their substantial impact on host cities. The environmental, economic, and social damages caused by past Olympics have influenced perceptions of such events. Over the past two decades, sustainability has become a core value for the International Olympic Committee, and the Paris 2024 Olympics created a unique experience through various sustainability strategies. The Paris 2024 Olympics have been promoted in the media as the ‘greenest’ Olympics to date. Additionally, as the most digitalized Olympics ever, Paris 2024 has made sustainability-focused strategies more widely known.

This study aims to analyze how the highly publicized sustainability strategies of the Paris Olympics on social media platforms are perceived by viewers. It focuses on the spatially based strategies of the Paris 2024 Olympics and examines their impact on environmental, economic, and social sustainability. The paper also includes a review of how these strategies differ from past Olympics.

The study analyzes the six most-viewed videos from international English-language news channels on YouTube that emphasize the sustainability of the Paris Olympics. The general approach of these videos and the perspectives of viewer comments are analyzed using content analysis with Maxqda-software. Sentiment analysis is conducted to assess how the sustainability strategy of the Paris Olympics is perceived.

Initial findings reveal that, despite neutral or positive portrayals in the videos, many comments criticize the so-called sustainability strategies as causing harm to both nature and the social fabric of the city. Some eco-friendly decisions are seen as ‘cheap’ attempts aimed solely at economic gain. However, some viewers appreciate these efforts. Suggestions also include holding the Olympics repeatedly in the same cities to reduce their impact.

The study highlights that sustainable development cannot be achieved through top-down policies alone; public awareness is crucial. Effective use of media can play a key role in enhancing positive perceptions of sustainability. The findings could encourage local and regional organizations to adopt more participatory decision-making processes for sustainable development.

**Key words:** Mega-events, Sustainable Development, Perceived Sustainability, Olympics

### **A SENSITIVE APPROACH TO THE HISTORIC URBAN LANDSCAPE. THE INTERWAR APARTMENT BUILDINGS OF THE LINEAR OPEN SPACE OF FOKIONOS NEGRI IN ATHENS, GREECE**

**Eleftheraki Georgina**

*Ph.Dc NTUA, National Technical University of Athens, School of Architecture, Greece*

[elefgogo@gmail.com](mailto:elefgogo@gmail.com)

#### **Abstract**

The Historic Urban Landscape (HUL) represents a carrier that humanity is obligated to preserve without interfering with the invincible force of change that is the city itself. UNESCO's approach to managing historic urban landscapes is holistic, integrating the goals of urban heritage preservation and economic and social development. In Athens, the legal framework protecting the architectural heritage of the city centre promotes archaeological richness and neoclassical interpretation for historical and political reasons, neglecting the protection and promotion of open spaces and important buildings of the 20th century. These buildings complete the image and identity of the city as modern monuments, interpreting the mechanisms of its evolution and how people accept it in their daily lives.

The research project "The Interwar Urban Landscape of Fokionos Negri Street: Documentation, analysis, interpretation" aims to study the historical urban landscape of the linear open space of Fokionos Negri, an area formed in the first half of the 20th century and hosts many buildings characteristic of "Athenian Modernism" and also, a very important area for the social and functional evolution of the Kypseli district and the Athenian centre.

One of the main aims is to identify and study buildings of particular architectural/historical/cultural value, which contribute in a specific way to the composition of the urban landscape, highlighting the overlapping layers of the city's history. In this presentation, we focus on interwar apartment buildings located along the Fokionos Negri Street through maps, archival research, personal observations, interviews of the owners and the patrons of the linear park, films and photo reports when the park was the central leisure pillar in Athens. The multimodal methodological choice seems provide information with interpretive value and depth of experience that can contribute to the understanding and appreciation of the historical urban landscape in Greece.

**Key words:** historic urban landscape, interwar urban heritage, Kypseli, Fokionos Negri Street, Athenian modernism

**Funding Information:** Funded by the Basic Research Program PEVE 2021 of the National Technical University of Athens.

## Abstract

At a time of energy transition, how can contemporary architectural design contribute to United Nations Agenda 2030 for Sustainable Development (2015) and the New European Bauhaus (NEB) which aims at transforming the European Green Deal's goals into tangible, positive experiences for the citizens?

Many contemporary green building rating tools and sustainability metrics have limitations in driving truly sustainable outcomes. Focusing narrowly on energy efficiency without considering the whole life cycle and broader environmental and social impacts can lead to suboptimal results. Knowing that the building industry is one of the major contributors to climate change, sustainable building design has to move from an energy efficiency-centered approach to a people-centered experience trying to link sustainability rating systems with the comfort of occupants and the conservation of natural resources. Buildings can act as significant catalysts for improving or degrading the quality of life and the environment.

This paper investigates the externalities of contemporary architecture in terms of sustainability. Mapping these externalities and shedding light on good practices is crucial for integrating sustainability into planning and helping the decision - making process to contribute to the transformation of the built environment for as many people as possible and for as long as possible. The collection of relevant data on design and construction of sustainable buildings will help establish design as a decisive factor for reducing carbon footprint and implementing design disciplines to confront contemporary problems such as climate change, access to resources, health and wellbeing. This research underlines the need for an integrative, multidisciplinary approach that sees architectural design not just as a technical or aesthetic endeavor, but as a driver of societal and environmental wellbeing.

**Key words:** Architecture, sustainability, externalities

## Introduction

Sustainable development in architecture focuses on creating buildings and infrastructure that meet present needs without compromising the ability of future generations to meet their own needs. This approach seeks to minimize environmental impact, enhance social wellbeing, and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

maintain long-term economic viability. According to the Davos Declaration (2018) the foundation of the Environmental, Social and Governance (ESG) standards in the built environment lies in the commitment to environmental protection -including addressing climate change- and in creating assets that are sustainable across all dimensions. In alignment with the Sustainable Development Goals of the United Nations’ Agenda 2030, the European Union has committed to reducing greenhouse gas emissions to net zero by 2050, ensuring a just transition to a carbon-neutral economy that benefits all citizens and regions, while fostering sustainable growth. Within this context, the NEB initiative (European Commission, 2021) aims to unite the goals of the European Green Deal (European Commission, 2019) with principles of aesthetics and inclusiveness. Recognizing the worldwide urge for a transition towards greener, sustainable, beautiful and inclusive built environments – as validated by the UN Agenda 2030 and the NEB - this paper explores the externalities of contemporary architecture in terms of sustainability.

### **The externalities of contemporary architecture in terms of sustainability**

Buildings are worth more than three times the size of global Gross Domestic Product (GDP) (Tostevin and Rushton, 2023). But while expenditure on contemporary architecture is quantitative and easy to calculate in monetary terms, the benefits of architecture as cultural good extend far beyond financial value. These include aesthetic, symbolic, social, educational, environmental, scientific and other values, many of which are inherently hard to measure (Throsby D, 2001). Even when buildings are owned and used by individuals or small groups, the impact is spread all over society and the economy because the built environment affects us all! In this sense, architecture can serve as a significant catalyst for improving or degrading the quality of life and the environment in many ways.

The building sector is one of the major contributors to climate change, being responsible for over 34% of energy demand, around 37% of energy-related CO<sub>2</sub> emissions globally, half of all raw material extraction, one-third of water consumption and one-third of waste generation. Rapid urbanization further exacerbates the situation, as cities and metropolitan areas are responsible for about 70 % of global carbon emissions and consume more than 60 % of available resources. Many impacts of contemporary architecture involve what economists call externalities: benefits or social costs arising as a result of a private activity for parties not included in this activity.

There can be positive externalities as well. For example, buildings designed with sustainability in mind can yield positive effects. For instance, buildings designed with sustainability in mind - prioritizing recycled, local, low carbon, energy-efficient materials aligned with eco-design can affect people and the environment in a positive way. It is becoming apparent that when creating beneficial externalities, the interest of society extends beyond the wellbeing of the direct users, the buyers and the sellers, to also include other people who are indirectly affected, the broader community and future generations. Beyond environmental concerns, architecture also generates social and cultural externalities. Thoughtfully designed buildings and public spaces can foster inclusiveness, accessibility, and a sense of community, thereby improving social cohesion and public health (Gehl, 2011). Health-related benefits such as improved indoor air quality, access to natural light and green

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

spaces further contribute to both physical and mental wellbeing (Evans, 2003). Culturally, adaptive reuse projects that preserve historical architecture help strengthen local identity and community resilience.

Given the significance of these multifaceted externalities, it is essential to adopt a holistic, multidimensional approach to analyzing contemporary architecture. Such an approach must account not only for energy performance and material efficiency but also for long-term environmental, social, and economic impacts. Mapping these externalities helps identify best practices and informs policy and design decisions that contribute meaningfully to sustainable development. Ultimately, architecture has the potential to play a transformative role in shaping a more resilient, inclusive and ecologically balanced built environment.

### **Contemporary architecture paradigms and sustainability**

Sustainable development in architecture involves designing structures that are energy-efficient, resource-conscious and supportive of both environmental and social well-being. One of the most effective strategies in this context is adaptive reuse, which focuses on repurposing existing buildings and infrastructure rather than resorting to demolition and new construction. By transforming a building's function—through spatial reconfiguration or architectural blending of old and new—resources are conserved, construction waste is minimized, and cultural heritage is preserved, while also helping to limit urban sprawl. Furthermore, incorporating reclaimed or reused materials into new designs not only reduces embodied carbon but also adds aesthetic character and uniqueness. Innovative approaches such as modular construction, including the use of shipping containers, support flexibility, ease of maintenance, and the potential for future reuse in response to evolving community needs. In parallel, the integration of green infrastructure such as tree planting offers a range of social, environmental, and economic benefits, including the mitigation of the urban heat island effect, the reduction of pollution, and enhancement of biodiversity. These principles can be seen in various architectural examples that successfully balance innovation with sustainability.

### ***Grand Park Bordeaux, Lacaton & Vassal + Frédéric Druot + Christophe Hutin architecture, 2016***

Prioritising the rehabilitation of three modernist social housing's buildings from the early 60's, architects Anne Lacaton and Jean-Philippe Vassal improved the living conditions and comfort of the residents, while also producing environmentally better-performing dwellings and improving the image of urban housing. Following their motto “never demolish, never remove or replace, always add, transform and reuse”, the architects added large winter gardens and balconies in extension of the existing structures, offering each apartment more space, natural light, flexibility of use and wider views. The addition of winter gardens also served as passive solar collectors, improving the energy performance of the building and reducing energy consumption by about 60%.

To complete the transformation in just 12-16 days per apartment, allowing families to stay in their dwellings during the construction works, the architects used prefabricated modules assembled in front of the buildings, with poured concrete used only for foundations. The renovation cost around €50,000 per unit - half as much as a new-build scheme - saving

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

approximately €26,5 million in total. As Lacaton stated, ‘Sustainability is also about the way that money is spent on doing something that lasts longer and is of greater use.’

The French duo reexamine sustainability through their reverence for pre-existing structures, conceiving projects by first taking careful inventory of what already exists. Lacaton emphasizes, “Transformation is the opportunity of doing more and better with what is already existing. The demolishing is a decision of easiness and short term. It is a waste of many things—a waste of energy, a waste of material, and a waste of history. Moreover, it has a very negative social impact. For us, it is an act of violence.” (Lacaton A., 2021). For their pioneering work Anne Lacaton and Jean-Philippe Vassal were awarded the Pritzker Architecture Prize.

### ***Redevelopment and reconstruction Munich Re, Sauerbuch Hutton, 2014***

The redevelopment and reconstruction of an existing dark office block of the 1980s by removing sections in its core and enabling natural ventilation and more natural daylight, reduced energy consumption and enhanced occupant comfort. The reuse of the building also involved the renewal of the façade which not only revitalized the building’s appearance and the surrounding environment but also improved thermal insulation, solar control and noise reduction contributing further to lower energy consumption (Sauerbuch Hutton, 2014). It was estimated that by retaining and upgrading the existing structure, enough energy was saved to heat the building for approximately 34 years.

### ***Dexamenes Seaside Hotel in Kourouta, K-studio, 2018***

An abandoned wine factory was revived and transformed into a resort. The existing concrete blocks of wine tanks were preserved and adapted into hotel rooms by removing slices of the tank walls to create doorways. These thick concrete slabs were then placed in a shallow pool in courtyard between the two blocks of tanks, forming stepping-stones that lead to two preserved steel silos. These circular silos now host art installations, spa treatments and private dining experiences (Pintos P., 2020). The shallow pool also contributes to the microclimate of the hotel. Although originally built for industrial use, the project successfully preserved the character and atmosphere of the historic structure.

### ***Design of the area around the Acropolis and the Philopappou Hill in Athens, Pikionis, 1959***

A Greek paradigm with great impact over time is the design of the area around the Acropolis and the Philopappou Hill, which has been declared a Monument of Modern Architecture of World Importance since 1996 (UNESCO) and the construction of the church of St. Demetrius Loumbadiaris, which at the end of works, in 1958, was declared a historical preserved monument, and have been awarded international awards from time to time. Dimitris Pikionis has given new life to the materials that come from massive demolitions of neoclassical buildings in the surrounding area. By reusing older stone, marble and ceramic fragments and composing them with concrete and modern brickwork seeks to artfully integrate the history of the site with the natural landscape and the more recent history. A logical “collage of the past and the present” (Antonakakis D., 1987) aimed at creating a new distinctive and balanced composition, without destroying the value of the elements that make it up.

### ***APROP Ciutat Vella Emergency Housing in Barcelona, Straddle3 + Eulia Arkitektura + Yaiza Terré, 2019***

The APROP Ciutat Vella Emergency Housing project questions the need for constructing new assets, especially when pre-existing structures are available for repair or upgrade. Serving as a shelter for residents who have suffered eviction, it was built within their own neighborhood using recycled industrial discarded containers, that were given a second life. From a sustainability perspective, the ecological footprint of a container-based apartment building is significantly lower than of a conventional residential building. These structures do not require the extensive use of reinforced concrete, are transportable, can be quickly assembled into settlements and are easy dismantlable and adaptable to new sites. This approach reduces both the energy required and the waste generated during demolitions. Furthermore, all dwellings have at least two facades, allowing for natural cross ventilation and special attention was paid to thermal insulation to optimize energy performance, achieving double A (AA) energy certification (Ott C., 2019). In this way, this housing model not only addresses urgent housing needs but also offers a socially responsible and ecological sustainable alternative that could influence future housing policies.

### ***Vertical Forest Milan, Boeri Studio, 2014***

Integrating green elements in contemporary architecture such as tree planting can have numerous positive effects on the overall building performance, on the surrounding neighborhood and on the environment. Green contributes to improved air quality, reduced energy consumption, enhanced mental health, and at the same time contributes to a more livable, resilient urban environment by moderating the heat island effect and lowering the overall environmental impact of buildings. The two towers feature as much vegetation as is normally found on around 30,000 m<sup>2</sup> of forest. The plants create an optimal microclimate; they also regulate humidity, carbon dioxide absorption, and produce oxygen. The vertical forest has become a habitat for a number of animal species, birds and butterflies (Stefano Boeri Architetti, 2014). The screen of leafy green trees not only reduces the need for air conditioning to heat and cool the tower's apartments, but also create a self-sufficient ecosystem.

### ***Tamedia Office Building Zurich, Shigeru Ban Architects, 2013***

Shigeru Ban, well-known for his innovative use of paper and paperboard, has designed an office building in Zurich made entirely of wood —specifically, 2,000 cubic meters of Austrian spruce, following Japanese construction traditions. The structure is composed exclusively of prefabricated, precision-milled timber elements, which were assembled on site. Timber, when sourced from sustainably managed forests, is an environment-friendly, renewable construction material offering a significantly lower embodied carbon footprint compared to conventional construction materials like concrete and steel. In addition to its environmental benefits, timber is known to have a positive impact on both physical health and psychological wellbeing. The building operates entirely CO<sub>2</sub>-free, utilizing geothermal groundwater for heating and cooling, without reliance on fossil fuels. Furthermore, high quality thermal insulation combined with the use of heat pumps ensures that the operational costs of this carbon-neutral wooden building remain low (Shigeru Ban Architects, 2013).

### Sustainability metrics

While environmental issues caused by the building sector show that green building design and construction is not an alternative, but a necessity, a precise definition of a broadly “sustainable” or “green” building does not exist yet. A series of green or sustainable building certification systems have however emerged over the past decades to provide to market actors recognized evidence of the quality of a building from a sustainability viewpoint. Building Research Establishment Environmental Assessment Method (BREEAM) which is adapted to European regulations and the Leadership in Energy and Environmental Design (LEED) which is U.S. centric are the most widely recognized sustainability rating systems around the world, focusing on a wide range of criteria. The LEED certification evaluates land use, water, energy and emissions, materials, indoor environmental quality, and innovation. BREEAM assesses project management, energy, health and wellbeing, transport, water, materials, waste, Land use, and Pollution. Applying for and obtaining certifications increases the cost of the investment but certified buildings can often provide increased return on investment, lower vacancy rates, enhanced brand reputation and visibility, maintenance and operational cost savings and potential tax incentives (UCEM, 2024).

But could the aforementioned projects or smaller renovation projects receive any of these certifications? On the other hand, many projects might appear extremely sustainable at a superficial level but are all these projects actually “green” with their overall context – physical, economic, social, etc.?

#### ***Bloomberg’s New European Headquarters in London, Foster + Partners***

Bloomberg’s New European Headquarters in London, designed by Foster + Partners achieved an Outstanding rating according to the BREEAM sustainability assessment method - the highest design-stage score - and has garnered significant international attention and awards (Foster + Partners, 2017). Compared to a typical office building, it saves 73% in water consumption, uses 40% less energy for lighting, features a ‘smart’ CO<sub>2</sub>-control system that dynamically adjusts airflow, and operates a combined heat and power generation system estimated to reduce CO<sub>2</sub> emissions.

While these green features have undoubtedly set new standards on sustainability, they have not been sufficient to prevent criticism regarding its designation as the world’s most sustainable office building. The use of 600 tons of bronze imported from Japan, 10,000 tons of granite from India, and serrated glass imported from China raised questions about the sustainability of the construction process itself. Furthermore, while the combined heat and power generation center is more efficient than a conventional system, it still burns natural gas, contributing substantially to the building’s total embodied carbon footprint.

One of the chief criticisms of standards like BREEAM and LEED is their focus on operational carbon emissions - the emissions produced during the building’s usage - excluding most of the embodied carbon emissions generated during construction, which can account for approximately half of a building’s lifetime CO<sub>2</sub> emissions (Waugh A., 2021). This focus encourages the designers to add unnecessary “systems” to achieve high ratings since mechanically-cooled buildings is easier to achieve higher ratings than naturally ventilated ones. This means air conditioning can be favoured over simple design solutions like operable

---

windows (UCEM, 2024). Although BREEAM and LEED have made modest updates to include embodied carbon considerations, significant gaps remain.

### ***PowerHouse Kjørbo in Oslo, Snøhetta, 2014***

An exemplary case of sustainable building design that integrates sustainability rating systems with the conservation of natural resources is PowerHouse Kjørbo, located outside Oslo and designed by Snøhetta. This project demonstrates the feasibility of transforming two existing office buildings, originally constructed in 1979, into energy-positive structures. Adopting a holistic approach, the renovation process simultaneously addressed architectural quality, energy efficiency, choice of materials, embodied carbon, and building systems—ultimately aiming to produce more energy than the buildings consume. A key objective was the reuse of materials and the selection of environmentally friendly construction alternatives, while preserving the buildings’ original structural identity. The design incorporated a ground-source heat pump system in combination with a highly efficient ventilation strategy. Photovoltaic panels were installed on the roofs, and the interiors were designed to maximize natural daylight, enhancing both energy savings and visual comfort. Notably, the project became the first rehabilitation initiative worldwide to achieve the highest possible rating in the BREEAM-NOR certification system (85.2%), earning both national and international recognition, as well as multiple awards (Snøhetta, 2014).

## **Conclusions**

Currently, the bar for sustainability is so low that often the “sustainability part” is completely ignored or the designers at the end just add a green roof or tons of solar panels just to tick off a check-list, without caring about solar panels after their 25-year-long life-span. On the other hand, while green building certifications undoubtedly have played a significant role in shaping sustainability discourse and influencing practices within the construction sector, their application is not without limitations. Even though they have evolved to integrate factors such as embodied carbon, they should not be followed blindly. Certifications may fail to reflect the full environmental footprint of a building and frequently neglect broader ecological and social implications. Furthermore, their rigid frameworks can inhibit recognition of innovative design solutions that deviate from established benchmarks yet achieve superior sustainability outcomes. In response to such limitations, the European Commission has introduced an evidence-based scientific handbook aimed at evaluating the built environment through the three core dimensions of the New European Bauhaus initiative – sustainability, aesthetic value and inclusiveness (Lourenço, P. et al., 2024).

Despite the challenges and the negative externalities associated with contemporary architectural practices, sustainable design holds significant transformative potential. Mapping the externalities of contemporary architecture which embodies sustainability into planning is crucial for creating a truly holistic approach to design, one that considers the long-term environmental, social, and economic outcomes. Such an approach can guide decision-making processes to contribute to the transition toward a built environment that is not only resilient and inclusive, but also beneficial to as many people as possible, for as long as possible. Ultimately the highest ambition of sustainable architecture is to regenerate and reconnect to

#### Abstract

One of the basic functions of a traditional public square is to be a central place for different outdoor events, such as open markets, cultural manifestations, concerts, or religious and political rallies. However, public squares without vibrant surroundings specifically dedicated to outdoor events are rather rare. In many cases, they are particularly formed for these purposes, but some have historically developed into public squares for events.

One such historical example is the Square of the Holy Trinity in Sombor, Serbia. Initially, this square was formed in the city centre to house all functions typical for a central urban square, including shops and administrative buildings in its surroundings. However, during the 20th century, the square in Sombor lost this initial multifunctionality, as surrounding buildings became protected as heritage and got mainly cultural institutions, while the square transitioned to be a city place for specialised mass events, such as a flower market on springs, ethno-bazaar on autumns or ice rink on winters.

The City of Sombor organised an urban-architectural competition for the conceptual (re)design of the Square of the Holy Trinity in 2023. One of the main premises given in the competition instructions was that all proposals for the new design had to preserve the function of a public square for various urban events surrounded by heritage buildings. On the other side, the very same instructions emphasise that the same design proposal had to make the square more functionally active and physically attractive for different users. These two, quite opposite stances made a challenging framework for the new urban design. Between ideas from urban design and the events literature, this paper aims to explain all these constraints during the design process and customisation of the final design for this Sombor square for public events.

**Key words:** redesign, public square, manifestations, cultural heritage, competition, Sombor

#### **Abstract**

As part of the "Architectural Design 2" course of the Civil Engineering Educators Department of the School of Pedagogical and Technological Education (ASPETE) that took place during the fall semester 2024-2025, students were asked to survey the Psallidi neighbourhood in Marousi, Athens and on this basis to choose a location for an urban intervention. Nine years ago, during the fall semester 2015-2016, in the "Urban Planning 1" course of the School of Architecture of the National Technical University of Athens (NTUA) students were asked to survey the Gazi neighbourhood in Central Athens and upon their findings to propose an urban intervention.

The methodology for the survey that has been proposed by the teaching team in both cases consisted of three kinds of maps, one analytical and objective and two perceptual and subjective: land uses, mental mapping and psychogeography (of both feelings and multisensory data).

Although coincidentally the two neighbourhoods have a similar trace on a map (size and shape), they differ essentially in that while Gazi is a dense, central area with a mix of uses and forms, Psallidi is a peripheral residential area with relative uniformity.

By comparing the students' maps that emerged from the two mappings, the paper attempts to explore how the latest time-perceptual and subjective approaches contribute to a better understanding of the content of urban space that extends beyond function and embraces aspects such as relationship and interaction of the individual with the urban space. Additionally, it is important to explore the impact on the forms and volumes produced in both areas as a result of the evolutions of the two areas based on their socio-cultural differences. Finally, this study will act as a pilot juxtaposition that will allow researchers to trace social, cultural, and urban function issues by following the triple mapping process.

**Key words:** mental mapping, psychogeography, urban evolution, Marousi, Gazi

[conhatzi@gmail.com](mailto:conhatzi@gmail.com)

#### **Abstract**

According to Jorge Luis Borges “city is always in search of poetic”. The ability of art to shape language, which differentiates each place, also determines its creative expression. Cinematic representation is a special process to investigate the way we imagine cities as an experience, but also as a theoretical construction, since the cinema projects authentic urban images, which interact with the city's residents. Movies allow us to draw some conclusions about how we experience real urban space, how we would like it to be, what we are afraid of or what we hope it can happen in the future. After all, cinema has no right to set aside life, but it must observe, listen and doubt...

As the architectural historian Francois Loyer mentions “to find out what a city is, we should not ask Le Corbusier, but Michelangelo Antonioni, Francesco Rosi or even Jean-Luc Godard”. The study and interpretation of the city in cinema seeks in its representations that social dynamic, which will allow a meditation about the city to be expressed. It is an opportunity to deepen into a theory of representation, for the sake of a theory of spatial practice.

The cinematographic lens roams the city streets, penetrates walls and touches its soul and mind, its myth and word on diachrony. It offers an ability of deepening and metamorphosing the fragmentary and ephemeral urban experience into systematized and unified knowledge, which makes us even capable of urban planning action in an effort for a sustainable, pleasant for children and therefore worth living city. After all the former General Secretary of the United Nations, Ban Ki-moon, pointed out that “our struggle for global sustainability will be won or lost in cities”.

**Key words:** cinema, representation, planning “tool”, urban, sustainable, worth living, city

### 1. Cinema in the city

The way in which man experiences the world at a certain period of his development is expressed in his art. Cinematic expression, in particular, is a kind of recording and processing of temporal experience. At the same time, the ability of art to shape a language that differentiates each place also determines its creative expression.

In moments when light and landscape dominate, consciously or not, in the world of images, cinematic depictions of cities and their details as elements of memory and knowledge for the viewer constitute a dominant urban mythology in contemporary cultural creation.

Besides, it is no coincidence that the development of cinema at the beginning of the 20th century coincided with the city dwellers' effort to capture the constant change of modern urban life and the ephemeral nature of events, to connect images and situations that follow each other at great speed, and to render them into a single whole.

Cinema was the first art that managed to “capture” space so completely. “It is a peculiar spatial form of culture” (Mark Shiel, 2001) that can be understood more fully if its aesthetic theory (space in films) and its “urban” practice (films in space) are studied.

The characteristics of the cinematographic film are not only found in the way in which man positions himself in front of the camera, but also in the way in which it depicts the world with its help. Cinema, based on the entire breadth of the visual and auditory sensory world, has the consequence of broadening and deepening our sensory perception. It is also a special means of exploring how we imagine cities as an experience but also as a theoretical construction. Films allow us to draw some conclusions about how we experience real urban space, how we would like it to be, what we fear, or hope may happen in the future. Essentially, it is an opportunity to delve into a theory of representation for the sake of a theory of spatial practice.

According to the architectural historian Francois Loyer, “To find out what a city is, we should not ask Le Corbusier, but Michelangelo Antonioni, Francesco Rosi or even Jean-Luc Godard.” The reading and interpretation of the city in cinema seeks in its representations that social dynamic that will allow a reflection on the city to be expressed. “You just have to keep your eyes open, then reality is charged with meaning,” M. Antonioni assumes. After all, cinema does not have the right to set aside life, it must see, listen, and doubt...

The cinematic lens roams the streets of the city, penetrates the walls of the buildings and touches its soul and mind, its myth and its discourse in timelessness. It offers a possibility of deepening and transmuting the fragmented and ephemeral urban experience into systematized and unified knowledge, which makes us capable even of urban planning action in the effort for a city that is not only sustainable, but also worth living.

After all, according to the former General Secretary of UN, Ban Ki-moon, “*Our fight for global sustainability will be won or lost in cities*”. But the city is not the problem, but the solution. In this context, the UN 2030 Agenda for Sustainable Development highlights 17 sustainable development goals to change the world, on a path towards dignity with a time horizon of 2030. In particular, goal number 11 focuses on the sustainable development of cities and communities, to create safe, resilient and sustainable cities and human settlements, without exclusions.

### 2. The UN 2030 Agenda for Sustainable Development

The 2030 Agenda for Sustainable Development was signed by the international community on 25/9/2015 during the 70th UN General Assembly and was characterized as a path towards dignity with a time horizon of 2030, as we did not inherit this world from our parents, but borrowed it from our children.

Indeed, on 25 September 2015, UN Member States agreed to create a common framework for sustainable development which included 17 goals that they should seek to achieve by 2030. These goals reflect the vision of the global community for our common desired future and indicate how the holistic approach to sustainable development will be achieved at Local, Regional, National and International levels. Its achievement is a one-way street for humanity, with no alternative avenues or prospects, as Ban Ki-moon (UN General Secretary from 2007-2016) characteristically stated, *“We have no plan B, because there is no planet B.”*

The term sustainable development first appeared at the United Nations Conference on the Human Environment held in Stockholm in 1972 and its definition was shaped by the World Conservation Strategy (1980), the Brundtland Report (1987) and the United Nations Conference on Environment and Development held in Rio (1992).

According to the Brundtland Commission, sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs.

In other words, sustainable development is undoubtedly essential for meeting human needs and improving the quality of human life. For this reason, it should be based on the efficient and environmentally responsible management of all the planet's scarce resources. It is development that seeks to meet the economic, social and environmental needs of society in a way that ensures short-term, medium-term and, most importantly, long-term prosperity. Essentially, sustainable development must meet current needs without compromising the well-being of future generations.

To understand the importance of the concept of Sustainability, one must consider the so-called “Three Pillars of Sustainability”, or in other words the corresponding aspects of sustainable development: social, economic and environmental. These three aspects are interrelated and if combined and implemented in practice, they can create a solid foundation for a sustainable world from which everyone can benefit, as natural resources are preserved, the environment is protected, the economy is not affected and the quality of life of citizens is improved.

Therefore, sustainable development is a combination of these three pillars. If any of the three pillars is “weak” then the system is not sustainable.

To be more specific, the three (3) pillars of sustainable development are:

1. Environment (use of natural resources, environmental management, pollution prevention)
2. Economy (profit, cost reduction, economic growth (growth) increase in GDP, i.e. increase in real national product, research and development).
3. Society (standard of living, education, justice and equal opportunities).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Today, it has become widely accepted that achieving sustainable development for a better future requires a holistic approach, which combines economic growth, social justice and environmental sustainability.

The Agenda 2030 promotes the integration of all three dimensions of sustainable development into all sectoral policies and promotes the interconnection and coherence of sustainable development policies, giving intellectual dimension and qualitative depth to the three pillars of sustainable development. At the same time, it emphasizes the importance of enhancing the participation of social partners, civil society, and all stakeholders in the development and implementation of national sustainable development strategies and programs.

Greece adopted from the outset, at the UN General Assembly on 25/9/2015, the Sustainable Development Goals (SDGs) of the 2030 Agenda. It has committed itself within the framework of the UN resolution to their implementation and therefore must mobilize its forces for this in combination with their appropriate adaptation to national priorities, specificities and needs.

Particularly in a country like Greece, which had been severely affected by the economic crisis and austerity policies, with an unprecedented reduction in national product and income and a drastic increase in unemployment, poverty and social exclusion, the 2030 Agenda offered:

- a) Arguments for the implementation of horizontal social policies towards fair and sustainable development, taking into account that the decade of recession widened income, social and regional inequalities and
- b) Procedures that favor open governance based on measurable goals.

### ***2.1 The 17 Sustainable Development Goals (SDGs) of the 2030 Agenda***

As mentioned above, the UN 2030 Agenda for Sustainable Development highlights 17 Sustainable Development Goals (SDGs) to change the world, on a path towards dignity, with a time horizon of 2030. The 17 SDGs are global, of general application and create implementation commitments for all countries, developing and developed, considering national realities. These are goals that are SMART, i.e. Specific, Measurable, Achievable, Realistic and Time bounded. In particular, SDG 17, cooperation, is also essential for all the others to function, as they are interdependent, interact and must cooperate. The SDGs are broken down into 169 sub-goals and 230 indicators for their measurement and evaluation by the UN and 99 indicators by the European Union (EU). The monitoring of the implementation of the SDGs falls under the General Secretariat of the Government of each EU Member State, with progress measurements at national level and reporting to the United Nations Directorate-General for International Cooperation and Development. The local adaptation and use of the 2030 Agenda for Sustainable Development at Member State level concerns all 17 SDGs. After all, the concept of Sustainable Development is reflected in both the preamble and the main part of the Treaty on European Union (TEU, 1992), while since 22/11/2016 the EU revised its position on Sustainable Development in accordance with the UN Agenda 2030, following a holistic approach to achieve the SDGs, which become binding within the framework of the European Union, in contrast to the UN Agenda 2030, which does not have a high degree of legal bindingness, as there are no sanctions. Now, the SDGs in the European

---

Union are turning into a source of inspiration for political decision-making. Strengthening its external action to consolidate the concept of sustainability in the rest of the world (developing countries) and at the same time seeking to improve the situation regarding the 17 SDGs in the EU itself.

### THE SUSTAINABLE DEVELOPMENT GOALS

UN Agenda 2030, Sustainable Development Goals.

More specifically, the 17 Sustainable Development Goals of the UN Agenda 2030 are:

- ✓ Goal 1: No poverty. End poverty in all its forms everywhere
- ✓ Goal 2: Zero hunger. End hunger, achieve food security and improved nutrition and promote sustainable agriculture
- ✓ Goal 3: Good health and well-being. Ensure healthy lives and promote well-being for all at all ages
- ✓ Goal 4: Quality education. Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
- ✓ Goal 5: Gender equality. Achieve gender equality and empower all women and girls
- ✓ Goal 6: Clean water and sanitation. Ensure availability and sustainable management of water and sanitation for all
- ✓ Goal 7: Affordable and clean energy. Ensure access to affordable, reliable sustainable and modern energy for all
- ✓ Goal 8: Decent work and economic growth. Promote sustainable, inclusive and sustainable economic growth, full and productive employment and decent work for all
- ✓ Goal 9: Industry innovation and infrastructure. Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation.
- ✓ Goal 10: Reduce inequalities. Reduce inequality within and among countries
- ✓ Goal 11: Sustainable cities and communities. Make cities and human settlements inclusive, safe, resilient and sustainable.
- ✓ Goal 12: Responsible consumption and production. Ensure sustainable consumption and production patterns
- ✓ Goal 13: Climate action. Take urgent action to combat climate change and its impacts

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- ✓ Goal 14: Life below water. Conserve and sustainably use the oceans, seas and marine resources for sustainable development.
- ✓ Goal 15: Life on land. Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forest, combat desertification, and halt and reverse land degradation and halt biodiversity loss.
- ✓ Goal 16: Peace, justice and strong institutions. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels.
- ✓ Goal 17: Partnership for the goals. Strengthen the means of implementation and revitalize the Global partnership for sustainable development

UN General Secretary, António Guterres points out: *“The Sustainable Development Goals are the path that leads us to a fairer, more peaceful and prosperous world and a healthy planet. They are also a call for solidarity between generations. There is no greater duty than to invest in the well-being of young people.”*

It is in this context that the commitments of the 2030 Agenda concerning the SDGs were formulated:

- “No one will be left behind”

- The 5 Ps of sustainable development are: people – planet – prosperity – peace – partnership

Therefore, sustainable development mainly requires changing behaviors, achieving another civilization, as we must keep in mind that whatever programs we design, they cannot succeed in societies that fail environmentally, socially, and economically. The 17 SDGs seek societies with economic prosperity and social development and qualitative characteristics, such as fair distribution of wealth, respect for social values and peaceful coexistence of people and nations.

### **2.2 The 11<sup>th</sup> SDG for sustainable cities**

Goal 11 of the 2030 Agenda focuses on the sustainable development of cities and communities, to create safe, resilient, sustainable cities and human settlements, without exclusion.

The 11<sup>th</sup> SDG of the UN's 2030 Agenda

However, as early as 2008 and for the first time in human history, the global urban population surpassed the global rural population, according to UN data.

---

The Morumbi favela, one of the largest slums in São Paulo

The ever-growing human population is now expected to increase dramatically in cities. Indeed, as of 2017, 55% of the world's population resides in urban centers, while by 2050 it is expected that 65% of the world's population, or approximately 6.5 billion people, will live in urban centers.

---

Los Olvidados, L. Buñuel, 1950

Cinema, since 1950 with the film “The Forgotten” (“Los olvidados”) by L. Buñuel, which depicted the slums of Mexico City for the first time, but also up to the recent “City of God” by F. Meireles (2002), which entered one of the most dangerous favelas in Rio, and “Slumdog Millionaire” by D. Boyle (2009), which was filmed in the Daravi favela in Mumbai, has turned its camera and focused on the slums and favelas of the third world.

The Daravi slum in Mumbai, where the film “Slumdog Millionaire” by D. Boyle was filmed, 2009.

Europe's cities are home to 3/4 (75%) of its population, as well as 70% of jobs, while 85% of European GDP is produced in cities. In Greece, half of its population is concentrated

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

in just 4.3% of its territory. According to Hellenic Statistical Authority data in 2011, 73% of the Greek population lived in cities, in 2022 the percentage exceeded 80% of the population. By 2050, it is estimated that 85% of European citizens will live and work in cities.

The consequences of population concentration in cities are:

- The abandonment of the countryside and the primary production sector (agriculture, livestock)
- The intensity of energy consumption
- The intensity of waste production
- The inadequacy of infrastructure
- The increase in pollution
- The climate crisis - deregulation
- The lack of social cohesion

Therefore, the main problems that arise in the city are:

- The concentration of unemployment
- Social isolation
- The concentration of poverty
- The acute environmental problems

While the various challenges that urban centers face are:

- Economic
- Environmental
- Climatic
- Social
- Demographic

It is now imperative to ensure livable living conditions for all citizens of a city, as another natural resource, space, is being dangerously depleted with the intensification of the phenomenon of urbanization. Goal 11 seeks inclusive cities and human settlements that are safe, resilient and sustainable and is broken down into the following sub-targets:

11.1: Housing, upgrading of slums.

11.2: Public transport and transport systems

11.3. Sustainable and inclusive urbanization, sustainable planning

11.4. Safeguarding world cultural and natural heritage

11.5. Addressing natural disasters

11.6. Addressing environmental pollution, saving energy.

11.7. Green public spaces for all (accessible without exclusion)

11.8. Support urban-peri-urban-rural partnerships

11.9. Increase the number of cities adopting integrated policies and plans (in line with the above sub-targets)

11.10. Support the least developed countries to build sustainable cities

Regarding Goal 11, Greece's commitment is to continuously strengthen, without exclusions, sustainable urban development and participatory, integrated and sustainable urban planning. In this context, Local and Specific Urban Plans are currently being drawn up in Municipalities across Greece and under the supervision of TCG (Technical Chamber of

---

Greece), implementing the EU-established spatial planning and sustainable urban development strategies. Having as main challenges:

- ✓ The expansion of urban activities beyond the defined urban zones,
- ✓ The construction of buildings and housing in some cases without prior appropriate planning and building permits, especially in coastal areas
- ✓ The need to increase public and green spaces in city centers
- ✓ The transition from outdated practices, such as landfill, to reuse and recycling with source separation, even at the domestic level
- ✓ Urban mobility

In the context of the local adaptation and use of the 2030 Agenda (localization) and the achievement of the Sustainable Development Goals, the purpose of sustainability is analyzed, which is composed of:

- ✓ Attractiveness (for citizens, investors, institutions, etc.)
- ✓ Preservation and improvement of the environment.
- ✓ Resilience (adaptation to climate change, preparedness to deal with natural disasters, economic crises, etc.)
- ✓ Responsible use of resources (natural, human and economic).
- ✓ Social cohesion (inclusiveness, reduction of inequalities, participation, etc.)
- ✓ Prosperity/ Well-being (quality of life, equal opportunities, human city, etc.)

In particular, the implementation of SDG number 11 for a sustainable city concerns the balancing of different and often competing needs at the environmental, social and economic levels, without compromising the capabilities of future generations to meet their own needs.

### **3. The physiognomy of the city in cinema. Cinema as a planning “tool”**

In films, cities are the “urban imaginary”, according to Ed. Soja, which constitutes a guideline not only for understanding, but also for reproducing urban space as a place and way of life, while at the same time confirming or opposing prevailing interpretations, desires and mythologies. The demand for self-knowledge and the need for shared spatial awareness is now placed at the basis of a variation of the triaxial spatiality according to Ed. Soja (Thirdspace, 1996), which includes:

- ✓ What is lived by the creator
- ✓ What is conceived by the cinematographic lens
- ✓ What is perceived by the viewer

Utopian or dystopian, the city is constituted as a pivotal point in the evolution of the human adventure, as cinema follows the footsteps of man on his journey to discover the lost city of the past and the imperative search for a city worth living in the present and sustainable in the future. A journey from space to its depiction, from speech to image, from architecture to cinema and vice versa.

The meeting of architecture and cinema in urban planning consists of the management of complexity and concerns the transversal communications between different fields and the possibility of innovative approaches to plan either through their collaboration or through its multiple representations. Different ways of storytelling are combined multiple times and produce representations. If, therefore, cinema represents the imaginary version of the real,

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

architecture remains as the real version of the imaginary. The dimension that defines them is time (Figure 1).

The relationship between architecture and cinema concerns a new sensitivity, a new “narrative”, a wandering in the “unfamiliar” reality of our cities.

In every art, experimentation precedes rules. Over time, the technique of cinema has also acquired its own method. Audiovisual composition, editing and mixing, are the "cinematic peculiarity", thanks to which the film restructures reality through contractions and expansions of space and time. It is the basic tool of cinema that makes it an art, differentiating it from other arts.

Cinema as an art of fragmentation and composition makes the succession of shots a potential reconstruction of our relationship with space and time. For the pioneering Soviet filmmaker Dziga Vertov, the camera, as early as the third decade of the 20<sup>th</sup> century, was not simply a substitute for the eye, but a tool that could overcome the shortcomings of human vision.

“The man with the movie camera”, D. Vertov 1929

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The entry of cinema into the city can be analyzed as a recording of a wandering course that reflects urban life as an event in time and the rhythm of the city as a sequence of shots in routes of representation of reality (Figure 2). Space is perceived in motion, that is, as urban life is experienced in its dynamic unfolding, while time is no longer calculated through movement, but itself constitutes its rhythm and measure. This is a new mythology of the city where wandering goes hand in hand with cinematic traveling and architecture with urban narrative.

Figure 2

Cinema is par excellence an “urban” art, its matrix is the city. It is another way of reading its semantic and emotional content and at the same time a representation of its spatial “reality”. The “iconology” of such an approach, as graphically presented in figure 3, highlights the relationship between the phenomenon of the city and its Architecture, and Cinema. Space as a place and as an object of representation is not inert and static, but contains vectors and speeds. Time as a flow arises from the succession of shots, while in its entirety it depends on editing, which reduces it again to movement and sequence of shots. Time does not flow only from the alternation of shots, but also within them. Editing invades them in order to create an interaction that will maintain their coherence by adopting a new balance. The journey of wandering goes hand in hand with the alternation of shots and temporal impressions. Its pace is synchronized with the rhythm of the city and the flow of shots. In particular, the form and rhythm of the metropolis offered cinema the evolution of its technique and discourse. The traveling of the camera visualizes the wandering, the movement in the metropolis, while editing is the only way to render its feverish rhythm and depict its “phantasmagoria”, its unexpectedness. The only way to tell the fragmentary stories that take place in its bowels, as it is the basic and necessary prerequisite of the aesthetics of the art of cinema, being the carrier of rhythm.

Cinema was not content with recording images and reproducing movement. It learned to produce movement with its own means and not only with the movements of the camera, the panoramic shot and the traveling shot, but with montage, which activates space and spatializes time and with the changes in shooting angle and distance between the object and the camera. It has the ability to act simultaneously fragmentarily and in flow, in parallel, intertwined, but also conflicting paths, with rhythm or against it, training man to stop standing and looking, but to observe, to know, to see...

It is a narrative, iconographic and design investigation for the revelation of the “truth” of the city.

## PROCEEDINGS

Figure 3

In particular, cinematic writing can be highlighted as a “tool” for reading, interpreting, evaluating and ultimately analyzing the quality and content of the city. Even as a “tool” for spatial planning, as it is original, beyond the traditional and usual, easy to use, now with the use of digital cameras, having the ability to provide complete and accurate urban information. It is indicative that already in the 1980s, sociologist W. Whyte filmed urban squares, parks and pedestrian streets, managing to analyze how urban spaces function and to suggest ways of designing successful public spaces. Today, with the development of digital technology applications from mobile phones to drones and even for a “handmade” DIY (Do It Yourself) Cinema, more and more possibilities are provided for research, analysis and synthesis of the parameters for the spatial planning of an urban area. Following a process of opposition between city and cinema (Table 1), urban narrative and script (story), urban planning study and reperege (field research), urban planning plans and decoupage (camera positions),

## PROCEEDINGS

movement in the city (traffic, networks) and the traveling of the camera and finally between the rhythm of the city and the cinematic technique of audiovisual editing (montage/ mixage).

| City                                        | Cinema                       |
|---------------------------------------------|------------------------------|
| Urban narrative                             | Scenario (story)             |
| Urban planning study                        | Reperage (research)          |
| Urban planning plans                        | Decoupage (camera positions) |
| Movement in the city<br>(traffic, networks) | Camera Traveling             |
| Rhythm of the city                          | Montage/ mixage              |

Table 1

Now, the camera records continuously. The new generation guides the digital camera, now, without separations, but also without “sensitivities”, towards a new form of “representation”. It is now the urban image that interacts with the passersby of the city. It is about direct cinematography with processes of participation and reflection, as dictated by the principles of direct democracy. In the era of globalization, economic crisis and pandemic, where the fictitious, the virtual, has been transformed into certainty, while the real, the true into uncertainty, all that is left to us is Godard’s admonition and a basic principle of cinema: “walk towards the light and illuminate the night...”

Therefore, the art of cinema does not concern the studio city, a sterile, unobtrusive image of the city, juxtaposed with an urban planning of distance, in opposition to any idea of immediacy. “*The city carries the momentum of life and is carried by it: the city, a game of synthesis between architecture and urban planning, within its volumes, its spaces and its light, is teeming with life*” will say Kostas Axelos. Cinema does not have the right to set aside life, it must see, listen and doubt...

The analysis of cinematic urban patterns requires, beyond the spatial, their sociological and anthropocentric approach, as the city is not only its image. The city is its people, its living forces, the cause that moves and unites them. It is the actions, thoughts and desires of its inhabitants, its myth, its discourse and its history. As director Thanasis Rentzis notes (2009): “*The city (which received a consciousness of itself through cinema) and cinema (which focuses on all points of urban space) are discussed and meditated upon productively and inductively, searching for common components and the intersecting discourse with the aim of understanding, revising and rearranging the terms of our fluctuating and long-suffering urban life.*”

The city now acquires its “animated” dimension by highlighting its “interpretations – roles” in cinematic writing. Thus, we have the “real” and the “imaginary” city, the “historical” and the “future”. At the same time, the attitude of the art of cinema towards the city is

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

revealed, which is sometimes critical, sometimes of projection and highlighting its historicity, through the creation of symbol cities and sometimes of laboratory, as in the case of Athens, which is projected in conditions of mixing historical standards and urban planning models. This is, as mentioned above, an opportunity to delve into a theory of representation, for the sake of a theory of spatial practice. A collage that emphasizes the parallel exhibition not only of different moments, but also of different types of representation of the city's physiognomy.

Through cinema, it is possible to predict the future of the city, as it is represented as the city of “the next day”, but also its current transformation, from the concept of “metropolis”, to the globalized “metapolis”. However, always keeping in mind the “other city”, the city of the 3<sup>rd</sup> world in the “new” order of things. Those parts of the big cities where misery, violence, illegality, poverty prevail. These are the slums, the marginal cities, the favelas, which are increasingly dense, as since 2008 and for the first time in the history of humanity, the global urban population has surpassed the global rural population. There, cinema does not entertain. It denounces, provokes, sensitizes, moves...

### **3.1 Filmed Athens**

In Athens, the coexistence of multiple spaces in the same place, such as the ancient Athens of monuments and the modern Athens of apartment buildings, results in the abolition of any sense of linear flow of time, which makes the city cinematic.

Regarding Greek cinema and its relationship with the city, the choice of protagonists who follow exactly the course of life and the evolution of post-war Athens is characteristic. From “The Neighborhood Girl” and “The Drunkard” (Or. Makris) of the old Athenian neighborhood (Plaka), we move on to the films with Logothetides (“A Pebble in the Lake”, “A Hero with Slippers”, “Fake Lira”), the classic Athenian bourgeois of the 1950s-1960s, to come to the typical internal immigrant, the sly, cunning, but honest, provincial Thymios Hadjichristou and to the crazy from the movement and modern rhythms, the anxiety and the frantic running of the troubled bourgeois of the 1960s-1970s period with Th. Vegos as his ideal interpreter. The decade of the 80s and 90s with the director in the foreground is characterized by a decadent social introversion (solitude of apartment buildings, drugs, etc.) until it reaches, from about the middle of the last decade of the 20th century and onwards, a focus on the immigrant, protagonist of Athens as “other”, as a foreign, but also as a strange city. And if the question was initially: who is the immigrant? in films such as “From the Snow” by Sotiris Goritsas (1993), with the dawn of the new century it mutated, focusing on a more internal search regarding the question of who we are in relation to the immigrant? in creations such as “Plato's Academy” by Philippos Tsitos (2009).

---

In cinema, what matters is the search for a sense of space and ourselves within the world and especially in the city, the depiction of our urban life in its dynamic unfolding. In space, as a real field of forces, it is the energy that in the case of the city emanates from its social dynamics, the sum of the forces that shape and define it. The dynamics of migration combined with the effects of the economic-humanitarian crisis and the pandemic of recent years now determine the social and cultural physiognomy of Athens and have a catalytic effect on the formation of its urban environment. The “stranger” has become our mirror. He is a resident, a part of ourselves and not just another user of our city, after all, as is pointed out in K. Katzourakis’ film “The Road to the West” (2003) “...and whoever does not have a job in his own place is also a stranger”.

The question of sustainability in the city is now being raised. Today, the future of metropolitan Athens, of the homeless, the unemployed and the immigrants, is at stake in the areas of disruption, in the in-between spaces, in the circulating urban voids, in the degraded zones, in the suspended spaces of otherness in the center and on the outskirts of the city. Places where bold and inventive design programs must be implemented and must be explored narratively and iconographically by the films. With studies on the limits, on the combinations, on the microscale, on the multiple scenarios of free appropriation of space by the resident, as in times of crisis, inventive adaptation is a privilege of the weak, in complete contrast to the entrenchment of the private, following a cinematic practice that mobilizes it, as it activates space and spatializes time in a process of developing a dialectical relationship between image and movement, where each sequence of images will become an object of reflection. Cinema fulfills the deepest need of man to see and hear without intermediaries, as it projects these places as they are and us in relation to them. Places that the eye has learned to avoid. As an art of audio-visual composition, it makes it possible to reinvent our relationship with space and time, since it cannot but represent what is at stake in these areas.

In the films of Athens, it is the cracks of time between the images that tell the story. The most remote suburbs, but also the intermediate spaces, the unbuilt areas, the urban voids in the city center and on its outskirts are the protagonists of its changes and contradictions. Both filmmakers and architects take refuge there as:

- ✓ They are the stitching points of the city, since its boundaries have evaporated
- ✓ They are spaces that function as repositories of memory
- ✓ It is today, the present that produces memory and shapes social dynamics
- ✓ It is a meeting place for forming ideas and inspiration.

In a globalized, crisis-ridden, and intercultural environment, Athens must now immediately focus on the faces of its residents, especially the most vulnerable, on an alternative experience and representation of the city, having as its sole prerequisite its self-awareness, in a process of transformation, not simply into a sustainable, but into a worth living city for all its citizens.

#### **4. The sustainable and ultimately worth living city**

The human population living in cities is constantly increasing and will increase dramatically in the long term. Combined with the fact that the pandemic, according to the UN, has increased the percentage of people worldwide living in slums to over 1 billion, it is now

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

imperative for a city that will be focused on people and therefore worthy of living in it. A “smart” city, which will make a conscious effort for the innovative use of technologies, information and communication networks (ICT) to support a more inclusive, diverse and sustainable urban environment. According to D. Papastergiou (former Mayor of Trikala) *“it is the city that “listens” to its citizens and together they proceed with projects and actions with substance and a human face”*. A city that, with the help of cinema, does not bypass needs, but projects them, does not ignore problems, but solves them, aiming for sustainability, with the human being as the only choice. A city that should be sustainable and at the same time resilient and “open” to design and offer services to all its citizens without exception, without discrimination, so that everyone feels part of a worth living city and at the same time a “smart” city that innovates and has in its DNA the change of culture. It is the place where traditional networks and services become more efficient with the use of ICT for the benefit of residents. The term “smart” city is an umbrella for how technologies can improve the efficiency of a city's operations and the quality of life of its residents, while at the same time promoting the local economy.

In a smart city, new technologies and innovation are the means for:

- ✓ Improving the quality of life of citizens
- ✓ Sustainable urban development
- ✓ Boosting competitiveness
- ✓ Creating new communication channels
- ✓ Access to information
- ✓ Ease of access and enhancing the efficiency of public services.
- ✓ Environmental protection
- ✓ Enhancing accessibility, safety, and comfort
- ✓ Mobility
- ✓ Social cohesion and integration.

As Dimitris Papastergiou (former Mayor of Trikala) notes: *“We essentially mean a city with a central, integrated strategic plan and steady steps towards specific directions. These directions have been selected based on the specific characteristics of each area. That is, the goal is to use the tools that allow for the improvement of the functioning of the Municipality for the benefit of citizens. “Smart” is not only the city with the use of IT, but also the one that uses its services correctly and with planning”*.

Therefore, “smart” is the city that increases the rate at which it provides social, economic and environmental sustainability results and responds to challenges such as climate change, rapid population growth and political and economic instability, radically improving the way it engages society, applies collaborative leadership methods, works across all sectors and systems of the city and uses data information and modern technologies to provide better services and quality of life to those in the city (residents, businesses, visitors), now and for the foreseeable future, without the existence of any unfair disadvantage among them, or the degradation of the natural environment.

But what does a “smart” city mean for the citizen?

- Increased efficiency and accessibility to services
- Reduction of poverty, unemployment and social exclusion
- Reduction of pollution and environmental impacts

---

- Collection of data for their disposal and reuse in the effective formulation of policies (open, anonymous data)

Now, the definition of sustainable cities combines traditional urban sustainability with the needs of modern cities (ICT and innovative participatory methods) the resilient with the smart city:

- Resilient city: promotes efforts to prepare for events (e.g. natural disasters) that constitute an existential threat to urban life, strengthening and securing the critical infrastructure on which it depends.
- Smart city: priority in the application of information and communication technologies (ICT) to urban management problems, aim to optimize city systems and services

Essentially, there are 5 principles for designing sustainable cities:

- Urban policy for the common good
- Integrated approach
- Participation and co-creation
- Multilevel governance
- Place-centered approach

The sustainable city open to new ideas and innovations is the tolerant and inclusive city, which welcomes a variety of people and cultures. A city of equal opportunities for all, open to the combination of the lifestyle and creativity of the population, with cultural and commercial diversity. In other words, a city where all its citizens feel that they are part of it, a worth living city which:

- Creates opportunities for diverse contributions and participation, inviting citizens to play a greater role in shaping their community and in social and economic development.
- Is connected to its citizens, as it responds to their goals and objectives.
- Designs and delivers, without discrimination, services to all its citizens.
- Reduces barriers to information and provides access to services through digital networks, connecting people wherever they are.
- Promotes unhindered consultation, participation and the recording of all opinions
- Is a consumer and mediator of technological solutions that promote transparency, collaboration and inclusion.
- Requires an “open” approach from urban planners.

It is therefore the sustainable city that can be “smart” and resilient, open and safe, and ultimately worth living, contributing both to the completeness of services and the quality of life of its citizens, as well as to sustainable development, which satisfies the environmental, social and economic needs of its citizens today, without compromising the ability of future generations to satisfy their own needs.

Therefore, it is imperative for a city to be centered on people and therefore worth living in. A worth living city, according to the professor of Ecology Panagiotis D. Dimopoulos assumes:

- A model of integrated development that is compatible with the environment, is founded on, goes hand in hand with and contributes to the social and cultural development of its citizens,

- The creation or strengthening of the characteristics of a fair and equal city,
- A rational urban planning based on criteria that protect the physiognomy of the city and serve the coexistence of the natural environment with the urban environment.

In order for a city to be sustainable, focused on people and their needs and therefore livable and enviable...

### 5. In conclusion

The relationship between city and cinema is highlighted not only in films that showcase the city, but mainly in those that represent the particularity of the urban phenomenon in its everyday life. An approach that must start from what the city is, which remains well hidden, as we do not see the city, we do not look at it in the eye, we do not try to understand it or feel it, we simply pass by it. “Because ultimately the highest intervention of the narrative art of cinema is that it challenges us to compare what we see and hear with what we live, with what comes to mind, with what we would like, with what we have tried, but also with what we have never thought or felt...” (S. Stavridis 1998)

Today, in the era of uncertainty, as a result of the economic-humanitarian crisis and the pandemic of recent years, the stakes are now to initiate a dialogue around the urban landscape, its changes and their impacts, as they are identified in cinematic representations and the pursuits of contemporary urban planning and architecture. The cinematic discourse on the city can constitute a new starting point in the effort to understand urban life theoretically and in practice; to become aware of the crisis of urban space and to confront the everyday violence it exerts through a process of reflection for an alternative representation of its “truth”. To highlight cinematic writing as a “tool” of urban planning, contributing to a process of formulating an “other”, contemporary language for architecture. An alternative perspective, another way of seeing the city, beyond the traditional and usual ones, which will make us capable of urban action. This requires the interdisciplinary analysis of cinematic urban models, focusing, in addition to urban planning, on their sociological and anthropocentric approach, as the city is not simply its image, but a living organism. Therefore, it is possible to develop a new field of urban action, which will be capable of recognizing and interpreting, analyzing and evaluating, through cinema, the urban, sociological, humanitarian and other issues of the modern city and, in particular, nowadays, a city in crisis. For the creation of not just a viable, but a worth living and at the same time enviable city. Always keeping in mind, the advice of the architect D. Pikioni: *“A little more humanity, deeper understanding and mental sensitivity – and everything changes: from the initial attitude to the details.”*

Today, the great stakes of the Greek city of the homeless and immigrants are at stake in the intermediate spaces, in the urban voids in the center and on the outskirts of the city. Cinema fulfills the deepest human need to see and hear without intermediaries, as it projects these places as they are with us in front of them. Places that the eye has learned to avoid. Cinema cannot help but represent what is at stake in these areas. The urban image interacts with the passerby of the city, developing a dialectical relationship between image and movement, where each sequence of images becomes an object of reflection. Both immigration, the economic-humanitarian crisis, and the pandemic of recent years, now constitute the social dynamics of the city, which determines the cinematic writing. After all, cinema as an art "in

---

motion" can capture urban life in its dynamic unfolding, highlighting the social phenomena that constitute this dynamic.

Now the game of the city is played in regenerations. At the same time, a new design on the scale of the city can bring about resistance to superficial change, the acceptance of the documentation of the city's cultural memory, the enhancement of the value of public space, the dialogical relationship with the environment that brings about essential changes in the relationship between public and private space. The point interventions for the transformation of the urban landscape, combined with the formation of a collective interest, a cultural consensus among the factors that contribute to their implementation, constitute the important first steps for a sustainable city. This collective interest can be initiated by cinema, focusing on the relationship between it and the city as a living social reality. In the context of the search for a sustainable and at the same time worth living city.

For cinema, the city is not simply a field for recording stories, which transforms it into a perceptible text. The spaces of the city themselves, with their function, guide the narrative. Stories are mapped with roads that can direct you everywhere, but also nowhere. But the urban landscape also contains a story, it contains an identity, a physiognomy. It affects people, creates a sense of time and a “cinematic” emotion, it is experiential, in short, the landscape is inhabited.

The cinematic possibility of a narrative about the city and at the same time a description of its image are those elements that can not only be projected, but also act catalytically in the formation of its physiognomy, as cinema was created to capture the eternal that constantly changes forms in contrast to architecture which aims to make the form eternal. As Doors singer Jim Morrison wrote in his notes on vision: “In dim light, form is sacrificed to light. In full light, light is sacrificed to form.”

But the city of cinema is never a definitive image. It is always in evolution, like its urban environment, as it is made up of people who experience it, feel it, are moved within it, it is a living organism. It is a city that is always invented, even when it is real. The cinematic image usually imposes fragmentary perspectives of the city, delimited by the frames chosen by the creator. As Jean-Louis Comolli (1996) said: “The cities that have been loved by cinema have been filmed as enigmas. They are there and they are not there, they hide at the same time as they reveal themselves, they escape and condense in the bodies that embody them, they disappear within them”. Therefore, it is not only cinema that “loses” the city, but also the city itself that has been “lost”. According to anthropologist Marc Augè, there is no longer anything but a city or a “desert”, so it is not exactly a city, as we considered it until today, but mainly a space that must be reevaluated, rediscovered from the beginning to evolve/ design the history of tomorrow. The subway stations, the informal settlements of the periphery, the ghettos of the urban center and the favelas of the third world megacities, are, in the same way as the highways, the waiting rooms at airports, the office towers and the malls of the spectacular metropolises, the undefined space of a history that, although we were completely unaware of, some inspired creators such as Wim Wenders, Jean-Luc Godard, Federico Fellini, became our eyes and ears and were able, through their images, to make us see and hear the noise it makes, as it approaches like a swell. While waiting for it, we must see and listen, be vigilant and focus on the city dweller of the new century. To design:

- Behaviors of people in the city, which will make it not only sustainable, but worth living for all its citizens, as sustainable development mainly requires a change in mentality to achieve another culture,
- Cities that children will love and want to live in, not only now, but also when they grow up.

Homeland, Syllas Tzoumerkas, 2010

In this context, Jean-Luc Godard (video: “moments from the history of cinema”) points out the contribution of cinema:

“What is cinema? Nothing  
What does it want? Everything  
What can it do? Something”.

#### **Abstract**

City-centered values are goods related to institutions and human rights in the urban context. The right to the city has been conceived by Henri Lefebvre as a radical challenge for participation of urban dwellers in decision-making, such as spatial planning, and for social inclusion. It has recently begun to be constitutionalized, as it is the case of the 2008 Constitution of Ecuador, which in article 31 regulates the right of persons “to fully enjoy the city and its public spaces”. The “right to Tourism Municipality” has not been consecrated, although Tourism Municipality has been introduced in some legal orders of Spanish Autonomous Communities. This institution enables cities, including coastal ones, to develop further their potential as tourism destinations, inter alia through additional financial support. There is a significant tendency of convergence of these urban guarantees, despite their heteroclite background. Besides, another potentially urban value consists in the port entelechy to hospitality being offered to people and ships. Both the magnificent invention of Aristotle, entelechy, and hospitality are absent from all Constitutions and could be constitutionalized by previewing that “Hospitality is the entelechy of the port”.

**Key words:** city-centered values, maritime values, port entelechy to hospitality, right to the city, right to Tourism Municipality

#### **Introduction**

The term “polis” declares the city-state but also encompasses the set of rights and obligations of citizens and is strictly related to culture. It would be interesting to focus on certain social and legal values related to the city and potentially to the maritime context, with emphasis on philosophical terms.

First of all, this paper will present the right to the city, an inspired innovation of the French philosopher Henri Lefebvre.

Then, it will refer to a newer institution, such as the Tourism Municipality, in the Spanish legal order.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Afterwards, it will adopt a more specific and detailed approach, to harbors, let alone in the current context of maritimization (Lecoq, 2014). It will look for the intrinsic destination of the port institution.

### **The right to the city**

In a year of intense political and constitutional changes in Europe, 1968, the right to the city was proposed in France by Henri Lefebvre. It was defined as the right of all urban dwellers to participate in the shaping of the city. The philosopher, in his work on “The Right to the City”, referred to the role of festivals within the urban space. Festivals are not seen as simply recreational events, but moments that transform and reconfigure the use and meaning of urban space. In this context, festivals can be considered acts that temporarily subvert the everyday order of the city, opening up possibilities for new forms of sociability and appropriation of space by the inhabitants.

In his conception of the right to the city, Lefebvre stresses that people not only have a right to the city in terms of physical access or urban services, but also in terms of their ability to participate in the production and transformation of urban spaces, as it is the case of urban planning. Festivals, with their ephemeral and festive character, embody a form of appropriation and playful use of urban space that escapes the routines imposed by capitalism and urban bureaucracy. They reflect cultural diversity, which can be interpreted as the principle of multiculturalism that can particularly favor minorities and representatives of cultures that do not have easy access to the media. They also illustrate the creativity of urban dwellers, contributing to the construction of a more inclusive and democratic city. They allow the city to be experienced differently, recovering a sense of community and collective participation that is fundamental to the idea of a full “right to the city”. Lefebvre criticizes how leisure in modern cities has been commercialized, becoming an extension of work and consumption. Instead of being a space of freedom and creativity, leisure in capitalist cities is often a time subordinated to the logics of the market, in which individuals are consumers rather than creators of their own free time.

It is notable that Lefebvre and Epicurus have visions that, although different in context, seek to transform the human experience for the better. Lefebvre, with his right to the city, emphasizes active participation in urban life as a form of freedom and fulfillment. Through festivals and the creative use of space, citizens reclaim their right to a living and collective city, escaping capitalist and bureaucratic control. On the other hand, the ancient Greek philosopher promoted friendship as one of the highest pleasures, an essential bond that provides peace and happiness in life. His approach stresses the importance of genuine relationships and community to achieve a fulfilling life. Both philosophers’ approaches value the importance of community and the creative use of space or relationships to challenge oppressive structures, proposing that true happiness and fulfillment are found in these acts of participation and connection.

Lefebvre’s archetypal approach was followed by the urban movements, according to which the economic system and its multiple expressions (real estate developers, large urban renewal projects, tourist industry, police) have a very negative impact on the collective ability

---

of inhabitants to lead fully satisfying lives. Later, the comparable concept of the inclusive city emerged, which is now applied to urban governance.

Urbanization is a strong trend of the 21st century, on a global scale. Slightly more than half of the planet's population now lives in cities. For some years now, The right to the city has been gaining ground in certain non-governmental organizations (NGOs), as witnessed inter alia by the Quito and Barcelona Social Forums in 2004, the World Charter on the Right to the City, popularized by Unesco, the European Declaration on the Right to the City, voted by the Chamber of Local Authorities in 2005, and the Right to the City Coalition (Paquot, 2012). In general, this right has been promoted internationally, especially through organizations like UN-Habitat, which has supported its inclusion in urban policies. In the 2030 Agenda for Sustainable Development, the governments of the world's States committed to ‘making cities more inclusive, safe, resilient and sustainable’.

An emblematic case of recognition of the right to the city consists in its incorporation in the 2008 Constitution of Ecuador, which in article 31 regulates the right of persons ‘to fully enjoy the city and its public spaces’. In addition, the Political Constitution of Mexico City, adopted in 2017, includes in its Article 12 the explicit recognition of the right to the City, as follows:

*1. Mexico City guarantees the right to the city, which consists in the full and equitable use and usufruct of the city, founded on principles of social justice, democracy, participation, equality, sustainability, of respect for cultural diversity, nature and the environment.*

*2. The right to the city is a collective right that guarantees the full exercise of human rights, the social function of the city, its democratic management, and ensures territorial justice, social inclusion, and the equitable distribution of public goods with the participation of the citizenry.*

Thus, this right is a guarantee that is proposed as a collective human right that promotes the fair, equitable, sustainable and democratic use of the city, in addition to emphasizing citizen participation in urban decision-making.

### **The right to Tourism Municipality in Spain**

Key concerns of the current era are how to secure ecological sustainability and the universal right to tourism, given that globalization has been conducive to economic crises worldwide and to political instability particularly in authoritarian and undeveloped countries (Maniatis, 2016). As far as the Spain is concerned, the institution of the tourism municipality appears with the approval of Law 7/1985 on Bases of Local Regime. Distancing itself from the tradition of the Regulation of services of the Local Corporations, approved by decree of June 17, 1955 that consecrates the municipalization like form of development of the activity of the municipality for the benefit of the economic services of its competition, assuming the risk of the Company by means of the power to regulate it and to control its regime, the Law uses the expression ‘municipalization’ only at the time of establishing the attributions of the plenary ones of the City councils and the regime of majorities applicable to the adoption of its agreements (Míguez Macho, 2017). However, it opens up a new potential role for the municipalities. It does not contemplate the figure of the tourism municipality in itself configured, but leaves open the possibility of creating special municipal regimes for those

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

municipalities “*that gather other characteristics that make it advisable, like its historical-artistic character or the predominance in its term of tourism activities...*” (Melgosa Arcos, 2011). Most of the Autonomous Communities have refrained from creating the category of tourism municipality, while those that have institutionalized it have not adopted a uniform regulatory treatment. These regulations are adapted to the particularity of a municipality that, due to its tourism attractiveness, has to take care of a high number of tourists, and they look for to ensure the quality of the services offered to them.

As regards the legislation of the Autonomous Community of Andalusia, the legal analysis of the applicable decree 72/2017 ends up to the conclusion that quality is the main objective while the purpose of this regime is not to compensate for the higher costs incurred by the influx of visitors, particularly in case of seasonality of demand, but to maintain and raise the tourism attractiveness of the municipality (Carmen Núñez Lozano, 2018). It is an approach focused on the tourism sector of the economy, considered as a strategic economic element of Andalusia, according to article 37.1.14 of its Statute of Autonomy, which is comparable to the constitutionalization of the tourism sector (“*Touristik*” instead of “*Tourismus*”, in German) in East Germany, in 1968.

Furthermore, it is noteworthy that in the Andalusian system considerable quantitative limitations of a demographic nature have been institutionalized. On the one hand, the premise to be able to obtain the status of “*Tourism Municipality of Andalusia*” is to have a population of no more than one hundred thousand inhabitants. On the other hand, it is important to note that this decree has eliminated the requirement that the municipality has more than five thousand inhabitants, introduced in the 2006 reform and, according to the doctrine, of dubious legality. The substantive requirements to achieve the status of tourism municipality are related to:

- a. The assisted tourist population, constituted by those who do not have the status of neighbors of the municipality, but have temporary stay, in the same for reasons of tourism visit or overnight stay in tourism accommodations,
- b. The tourism offer, which must have such consistency and attractiveness that it is capable of generating a flow of visitors to the municipality,
- c. The municipal plan for tourism quality that contemplates the measures of improvement of the services and benefits,
- d. The elements of valuation, among which the element “*m) Existence of an urban planning that contemplates the endowments of free spaces and others that fulfill the minimum reserves foreseen by the urban planning legislation, justifying its incidence on the assisted tourist population*” (Rivero Ysern, 2008).

On the one hand, the declaration of a municipality as tourism municipality implies obligations for the Administration of the Autonomous Community of Andalusia, which will be obliged to consider it as a priority in the actions of planning and promotion of its economic plans when it is compatible with the objectives of the same and, where appropriate, with the finalist nature of its financing. Essentially, the right of the tourist municipality to be a beneficiary of the management and promotion actions of the sectorial economic plans has

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

been consecrated. It should be noted that the legislation on the matter avoids using the term “right” for the legal relationship of the municipality involved vis-à-vis the Autonomous Community, which shows a conservative spirit, perhaps to protect the economic resources of the Autonomous Community against an enforceable right. However, fundamental rights belong not only to natural persons, such as citizens, and legal persons under private law, illustrated by the majority of companies, but also to legal persons under public law that are part of the institution of local self-administration. In addition to the above, at the juridical level it is unusual to regulate a legal relationship by referring to obligations or duties of one party and at the same time not to symmetrical rights of the other party.

On the other hand, the tourism municipalities must carry out actions aimed at promoting and improving the actions and services with an impact on the tourism activity. Other obligations that are directly imposed are the following:

*a) To introduce mechanisms of citizen participation and of the economic and social agents in all the processes of tourism planning that are carried out.*

*b) To integrate the conservation of the cultural and natural patrimony in the tourism planning, paying special attention to the intangible patrimony and to the values, customs and own traditions of the municipality.*

*c) Promote universal accessibility of local tourism resources.*

*d) To promote tourism that respects the environment and its inhabitants, that takes into account the carrying capacity of the destination and is aware of the limited natural resources of the territory.*

*e) To raise awareness among the local population and the assisted tourism population of the importance of responsible tourism practices, promoting egalitarian, educational and outreach activities on tourism and sustainable development.*

It should be emphasized that the reference to the intangible heritage and to the values, customs and traditions specific to the municipality is original, within the framework of the rules of the Autonomous Community on tourism municipality. It is an opening, among others, to the maritime values of tourism municipalities in the coastal area of the Autonomous Community, such as Roquetas de Mar and Níjar in Almería, Tarifa and Conil de la Frontera in Cádiz, as well as Almuñécar in Granada and several localities in the province of Málaga such as Nerja, Benalmádena and Torremolinos. The number of municipalities officially recognized as “Tourism Municipalities of Andalusia” has been 46. However, throughout the decree there is no word “hospitality”, which could perhaps be considered as implicit, among others, in this point. In any case, it is problematic to regulate in detail the category of the tourism municipality, without highlighting the value of human rights and fundamental principles of direct relation with tourism, such as the right to safe travel and the principle of hospitality, while the institution of the tourism municipality, itself, is not institutionalized, at least explicitly, as an authentic “right”.

### **The port entelechy to hospitality**

Instead of giving terms to literature, as Plato did, Aristotle built the terminology of science and philosophy we can hardly speak of any science today without employing terms which he invented; they lie like fossils in the strata of our speech: *faculty*, *mean*, *maxim* (meaning, in

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Aristotle, the major premiss of a syllogism), *category, energy, actuality, motive, end, principle, form* – these indispensable coins of philosophic thought were minted in his mind (Durant, 2006). Besides, development is not haphazard or accidental (else how could we explain the almost universal appearance and transmission of useful organs?); everything is guided in a certain direction from within, by its nature and structure and entelechy (Durant, 2006); the egg of the hen is internally designed or destined to become not a duck but a chick; the acorn becomes not a willow but an oak. It is to underline that Aristotle invented a complex word on the matter, consisting in entelechy (*entelecheia*) – having (*echo*) its purpose (*telos*) within (*entos*); one of those magnificent Aristotelian terms which gather up into themselves a whole philosophy (Durant, 2006).

The entelechy has been recently used to localize the inner destination of harbors (Maniatis, 2024). More precisely, the port has a diachronic, intrinsic purpose, strictly related to the ideal of safety and security of both people and ships, which consists in hospitality, a term thoroughly omitted until the emergence of this theory. Moreover, the principle of hospitality is a taboo, not only in the port context. The concept of the port as a public institution offering hospitality even to foreign-registered ships has been reinforced historically, after the Middle Ages in Europe, on the basis of the gradual improvement of seaports and coastal states. From the 15th century onwards, this is the case with important institutions and developments, such as the domination of ports by European monarchs, the emergence of the territorial sea as a zone of sovereignty of the coastal State and the introduction of maritime cabotage. To the extent that coastal countries with traditional military and maritime power were strengthened in legal and empirical terms, they could transfer their strength to the expression of economic activities, such as fishing and shipping, and above all to hospitality, against natural and social dangers. Hospitality constitutes by nature a form of welcome, inclusion and shelter by a person or a social group that is endowed with sufficient material goods, such as residence, to a person in need.

Besides, the aquatic abysses symbolize the hospitality offered to living species. Throughout the vast isothermal zone, known as the “hypolimnion”, temperatures are extremely stable, ranging from 0.5°C to 4°C (Cabé). The density of water is greater than 4°C and, as a consequence, the temperature at the bottom of a lake or ocean does not drop below 4°C (because colder waters are lighter), something that allowed life forms to survive during the coldest geological periods (Pech). Consequently, the sea or a lake has been a kind of true refuge for biodiversity, so that these aquatic spaces have proven to be hospitable par excellence in situations that are not very favorable for the survival of species. It is worth noting that the Greek word for harbor, namely “limén”, and the word “hypolimnion” share both etymological origin and functioning. In conclusion, hospitality is the entelechy of the port, which serves as a foundation for an anthropocentric and integrative approach to the maritime context.

As far as the word “marina” is concerned, in the tourism field it refers to a port specialized in providing services and facilities for recreational vessels, such as yachts, sailboats and motorboats. The first marinas on a global scale emerged in the second half of the 19th century, coinciding with the rise of luxury tourism and recreational boating among the European upper classes. During the 1950s and 1960s, there was an exponential growth in the construction of marinas in areas of tourist interest, such as the Mediterranean and Caribbean

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

coasts, aimed at the growing demand for recreational boating. The concept of the modern marina developed as nautical tourism grew as a recreational activity for economic elites and expanded to broader sectors, becoming an integral part of coastal tourism in many parts of the world.

Unlike commercial or industrial ports, marinas are designed specifically for private vessels and offer a suitable infrastructure for nautical tourism. It is a tourism port that has facilities for mooring and berthing recreational boats, and services such as fueling, electricity, drinking water and boat maintenance. It should be emphasized that the marina is not merely intended for individuals with tourist boats, but is also combined with leisure infrastructures, such as restaurants, nautical stores, and in some cases, nearby hotels or resorts. In many cases, marinas offer boat rentals and other recreational activities centered on sailing.

These public spaces promote the constitutional right to teaching and education, and also indirectly the related right to research, in the field of marine-related leisure and maritime tourism. Hobbyists have the opportunity to attend specialized schools there, such as sailing or diving, which can contribute to the ecological and cultural awareness of the participants. This development is comparable to a project of the French State, within the framework of the second National Strategy of the Cuesta Sea, which covers the period 2024-2030. This project consists in “*Using tourism, leisure activities and MEAs (educational marine areas) to turn the coastline into the first space for environmental education*”(Gouvernement)

The operation of a marina is sometimes not without problems, such as coexistence with the inhabitants of the city of reference. For example, a measure was implemented to prohibit nighttime access to the marina in the Greek city of Kalamata. This ban resulted from a court decision in the first half of the 2000s, but did not become permanent practice. Finally, the company entrusted with the management of the marina opted for a liberal approach, so that today it guards the area, through its own personnel, thus ensuring safety. It is noticeable that in reality there is a risk, not only at night but also during the day, of crimes being committed against the interests of the private individuals involved. It is not first and foremost the local businesses, such as restaurants, but the property of the users of the marina facilities that are at risk. It is the general principle of hospitality and above all the people’s right to the city that emerged victorious in this case, which has an unusual jurisdictional dimension, if not unique, at least as far as Greek marinas are concerned.

## Conclusion

The aim of this study was to investigate certain city-related values, illustrated by urban maritime values. It ends up to the conclusion that the right to the city is an important guarantee, which recently has gained territory. This is true even at the constitutional level, for the first time in the 21st century. It is about a realistic, inclusive approach to cities, especially to industrialized big cities which constitute an important place of attraction for both immigrants and tourists, such as Paris. The French capital—and more specifically, the transformations it underwent in the 19th and 20th centuries—provided a critical backdrop for Lefebvre’s reflections on urban space, capitalism, and social struggles.

Furthermore, although the concept of tourism municipalities is not often explicitly mentioned within the doctrine of the right to the city, there is a clear relationship between the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

two phenomena, for example, in the sense of how citizens participate in the planning and management of their environment. Tourism municipalities are localities whose economic development is centered on tourism, which can generate tensions with respect to the rights of permanent residents. In this context, the right to the city could be interpreted as the defense of the interest of local inhabitants against the effects of tourism exploitation that, in some cases, prioritizes the needs of visitors over those of residents.

In the Spanish legal system, there is no direct reference between the right to the city and tourism municipalities, but the regulations institutionalize public open spaces as one of the criteria for a municipality to qualify as a “tourism municipality”, while the question of people’s access to the city’s public spaces is a key element of the content of this right in comparative law. Spanish regulations aim to manage the impact of tourism and balance it with the rights and quality of life of residents, something that could be considered aligned with the principles of the right to the city insofar as they advocate an equitable use of urban space and citizen participation in its development. It should be emphasized that some of the aforementioned obligations of the Tourism Municipality of Andalusia, particularly obligation number e), are very indicative of the need to develop responsible tourism, compatible with the rights of the inhabitants of the city visited, essentially their right to their own city.

To the extent that the port is part of a tourism municipality, it is endowed with the two above-mentioned urban values. In any case, it includes its own value, which is the Aristotelian magnificent invention consisting in entelechy. The telos of entelechy is a rather marginal and controversial ideal, hospitality to various entities, such as inter alia persons and ships. This form of entelechy is a self-existent guarantee, which is not limited to the rights of the persons involved or to a mere principle.

The intrinsic character that is typical of the philosophical concept of entelechy ties in with the natural character of the hospitality offered by the waters of the sea or the lake towards biodiversity in the hypolimnion zone while the etymology of the Greek words for port and lake suggests the contribution of both entities to hospitality.

Such an approach is accentuated with regard to the tourist port par excellence, which consists in marina. Not only the marina but also the other types of port would deserve a sustainable development approach, against phenomena of multipurpose deconstruction, which diminish their usefulness and prestige.

All in all, we must emphasize that the present work highlighted the existence of a system of novel city-centered values, with philosophical background, which are much or less recognized at juridical level. Furthermore, it puts the stress on the concept of entelechy, which should gain territory at the constitutional level, as a new term, especially as far as the category of constitutional guarantees are concerned. For instance, it is recommended to preview that “*Hospitality is the entelechy of the port*”. In such a case, the novelty would be double, given that no Constitution on global scale makes an explicit reference to hospitality...

\*\*\*

Hospitality is not only the entelechy of the port, but also the offer of nature.

### THE ELLINIKON: A CASE STUDY OF SUSTAINABLE URBAN REGENERATION AND DEVELOPMENT

**Rachiotis Theodoros**

*PhD Candidate, Department of Physical Education and Sport Science, National and Kapodistrian University of Athens*

[theorax@phed.uoa.gr](mailto:theorax@phed.uoa.gr)

**Poulaki Panoraia**

*PhD Academic Teaching Staff, Department of Economics and Management of Tourism, University of the Aegean*

[panoraia@aegean.gr](mailto:panoraia@aegean.gr)

#### **Abstract**

The Ellinikon project, known as "The Ellinikon", is the largest urban regeneration project in Europe, transforming the site of the former Ellinikon International Airport into a modern, sustainable city. The project includes the creation of a 2,000,000 sqm coastal park, neighbourhoods with state-of-the-art residences, shopping destinations, gastronomy and entertainment options, luxury hotels, casinos, business offices, conference centres, education, sports and cultural centres

The methodology of the study includes a comprehensive review of existing literature on urban regeneration and sustainable development, as well as a case study analysis of the Ellinikon project. The review will examine theories and practices of sustainable urban development, while the case study will focus on the design, implementation and challenges of the project.

Expected outcomes include the emergence of Ellinikon as a model of sustainable urban development, with an emphasis on the creation of green spaces, the integration of new technologies and the promotion of the circular economy. In addition, it is expected to contribute to the economic development of the area, creating new jobs and attracting tourism. The study will provide valuable insights for the implementation of sustainable practices in future urban regeneration projects.

**Key words:** Ellinikon project, sustainable urban regeneration, economic development, case study.

## Abstract

The relationship between territories and energy has long been a subject of interest in urban studies. This study revisits paradigms that have historically influenced this relationship, while adopting a conceptual approach analogous to autotroph systems—self-sustaining processes capable of generating energy internally without significant reliance on external inputs.

Territorial spatial organization and administrative boundaries are typically not structured with regard to the dynamics of energy consumption and production. By reinterpreting territories through an energy-balance perspective, this paper explores the potentiality of energy autonomy through dynamic exchanges among the territorial components.

To initiate a dialogue on such a redefinition that could stimulate a transition in energy distribution, a case study linked to the ideal capacity of a territory to self-sufficiency is interrogated. This reading proposes a reinvention of territorial organization—one that evolves as a dynamic system interwoven within interconnected complex relationships.

Using the Île-de-France region in France as a case study, the research employs GIS tools to translate various types of land uses into energy-producing and energy-consuming spaces. It further identifies sub-spaces and zones at different scales that bear energy balance characteristics. This reinterpretation of the territorial limits and peripheries, lean towards a new cartography of the territory in question.

The proposed experimental approach envisions thus an energy mix analogous to land-use mixes, suggesting a transformative framework for territorial organization. Such a potential paradigm shift in a territory's metabolic processes could lead towards a framework focused on conserving energy cycles and achieving sustainability, drawing an analogy with the autotroph systems.

**Key words:** urban metabolism, energy autonomy, autotrophic systems, territorial organisation

# GOVERNANCE AND SUSTAINABILITY OF SPECIAL URBAN PLANS IN THESSALONIKI: PUBLIC PARTICIPATION AND URBAN TRANSFORMATION

**Theodorakopoulou Vasiliki**

*Student, Aristotle University of Thessaloniki, School of Architecture*

[tvasiliki@arch.auth.gr](mailto:tvasiliki@arch.auth.gr)

## Abstract

The financial crisis in Greece highlights the urgent need for reforms to promote development. A central pillar of these reforms has been the promotion of strategic investments and the introduction of innovative tools in urban planning, such as Special Urban Plans (SUPs). These plans aim to address urban challenges by offering flexibility and adaptability. However, their complexity and novelty have made it challenging to draw definitive conclusions about their impact on urban space. Are SUPs effective in fostering sustainable urban development as intended? To what extent do they engage citizens in their processes and ensure high-quality urban planning?

Thessaloniki, Greece's second-largest city, serves as an ideal case study for exploring these questions. The city faces pressing challenges, including population density, environmental degradation, and insufficient infrastructure, making SUPs a critical strategy for urban transformation.

This paper evaluates the sustainability of SUPs in Thessaloniki using a multidimensional approach that combines qualitative and quantitative analyses. It focuses on sustainable strategies by examining policies, urban interventions, and their socio-environmental impacts. The findings contribute to a deeper understanding of the effectiveness of Thessaloniki's SUPs, offering actionable insights for improving their implementation to achieve more inclusive and sustainable urban development. Evidence suggests that SUPs have the potential to foster urban resilience and enhance quality of life. However, challenges such as limited public engagement and inadequate sustainable outcomes persist, highlighting areas for improvement.

**Key words:** SUPs, Urban Sustainability, Urban planning, Socio-environmental Impact, Thessaloniki

### THE CIRCULAR ECONOMY - A RESPONSE TO CLIMATE CHANGE

**Dzintra Atstāja**

*Professor of the Faculty of Social Sciences at Riga Stradiņš university,*

*Lead researcher at BA School of Business and Finance, Latvia*

[dzintra.atstaja@gmail.com](mailto:dzintra.atstaja@gmail.com)

#### **Abstract**

Circular economy - an economic system aimed at eliminating waste and continuous use of resources. It includes sharing, reusing, repairing, renovating and recycling to create a closed system. All waste becomes a resource or raw material for the next process, thus contrasting with the traditional or linear economy, in which the production model is take - make - use - throw away.

Municipalities have the greatest influence on outcomes – by setting an example and shaping the environment.

Considering Latvia's unique characteristics and the role of local governments in the circular economy, their importance has been established.

This article will tell about the methodology development and results of the first Latvian Circular Economy Index. It is commendable that all Latvian municipalities have been evaluated.

Self-assessment of municipalities and population surveys are included in the methodology. The resident's survey was conducted online (CAWI) using a closed, representative respondent panel. The survey asked residents about the municipality's and their own activities in the field of circular economy.

The Circular Economy Index for municipalities, developed for the first time in Latvia, will provide an opportunity to self-assess the processes and results in the work of institutions, organizations and municipalities. It will also be possible to follow the dynamics of your performance by years or periods and compare it with the results of others. At the same time, it will be possible to receive expert recommendations on priority processes to be improved, as well as promote success stories and examples of good practice.

Based on the self-assessment and index methodology, it will be possible to better understand the role of the circular economy in the work of institutions and organizations, in the performance of municipal functions, and in cooperation with interested parties.

Recommendations for more responsible behaviour, support mechanisms and fundraising are available for municipalities.

**Key words:** Circular economy index, Municipalities, Latvia

### INTEGRATING CIRCULAR ECONOMY IN TO SUSTAINABLE DEVELOPMENT GOALS: INSIGHTS FROM LIFE CYCLE IMPACT ASSESSMENT

#### **Abstract**

The integration of the circular economy into sustainable development goals offers an approach to sustainable resource management and economic growth, with Life Cycle Impact Assessment (LCIA) as a tool for evaluating environmental and socio-economic outcomes. This study investigates how LCIA methodologies can drive circular economy strategies within the textile industry, addressing sustainable development goals and targets such as responsible production and consumption and climate action. Textile production, which accounts for approximately 10% of global carbon emissions and 20% of industrial water pollution, presents significant opportunities for circular economy practices like recycling, reusing, and material innovation. Case studies from European textile manufacturers demonstrate the potential of LCIA in optimizing resource use, minimizing waste, and reducing greenhouse gas emissions by up to 50% when transitioning from virgin polyester production to closed-loop recycling systems. LCIA software tools such as OpenLCA and GaBi were employed to assess the environmental impacts across lifecycle stages, including raw material extraction, manufacturing, distribution, and end-of-life disposal. Results indicate that incorporating recycled fibers can lower energy consumption by 30–40%, while water usage can be reduced by as much as 70% compared to conventional production methods. Furthermore, the adoption of eco-design principles, supported by LCIA insights, showed a potential reduction in landfill waste by 25% through product lifecycle extension initiatives such as repair and reuse programs. This research highlights the socio-economic implications

---

of circular economy adoption, including job creation in recycling and upcycling sectors, which could increase by 15% in regions implementing waste management systems. Policy recommendations emphasize the importance of regulatory frameworks that incentivize sustainable practices, such as extended producer responsibility and subsidies for green technologies. The findings show the value of cross-sector collaboration, combining insights from LCIA with circular economy strategies to improve sustainable consumption patterns and support the transition towards a low-carbon textile industry.

**Key words:** circular economy, life cycle impact assessment, resource management, recycling and reuse

### Introduction

The global textile industry is one of the most resource-intensive and environmentally damaging sectors, contributing to 10% of global carbon emissions and 20% of industrial water pollution (Ellen MacArthur Foundation, 2019). As concerns over environmental sustainability intensify, circular economy principles have gained momentum as a transformative approach to addressing the industry's environmental and socio-economic challenges. The circular economy promotes closed-loop systems that minimize resource extraction, optimize waste recovery, and extend product lifecycles. In the textile sector, this translates into strategies such as fiber-to-fiber recycling, eco-design, and sustainable material innovation. However, effectively integrating these principles into industry practices requires quantitative assessment methodologies to evaluate their environmental and economic benefits. This is where the Life Cycle Impact Assessment is most commonly used. LCIA represents an analytical tool used to quantify the environmental impacts of a product or process across its entire lifecycle, from raw material extraction and manufacturing to use and end-of-life disposal. With LCIA, industries can identify environmental hotspots, optimize resource efficiency, and compare the sustainability performance of different circular economy strategies. Despite the increasing relevance of LCIA, its integration with CE strategies within the textile industry remains underexplored, particularly in the context of achieving sustainable development goals. This paper aims to bridge this gap by analyzing the role of LCIA in driving circular economy transitions within the textile industry. By focusing on sustainable development goals targets such as responsible production and consumption (SDG 12), climate action (SDG 13), and sustainable industry innovation (SDG 9), this study analysis how LCIA methodologies can improve decision-making for sustainable textile production (Hales & Birdthistle, 2022), (Küfeoğlu, 2022). The United Nations Sustainable Development Goals (SDGs) provide a global framework for sustainable economic, social, and environmental progress. The textile and apparel industry, valued at approximately \$2.4 trillion, is a driver of economic growth and employment, yet it remains one of the largest contributors to pollution, carbon emissions, and resource depletion (UNEP, 2022). The integration of circular economy principles within the textile industry aligns directly with sustainable development goals, specifically: (1) SDG 12 - Responsible consumption and production, meaning reducing textile waste through recycling, reusing, and material recovery; (2) SDG 13 - Climate action,

## PROCEEDINGS

---

meaning that lowering carbon emissions through LCIA-informed eco-design and closed-loop production systems; (3) SDG 9 - Industry, innovation, and infrastructure, meaning encouraging sustainable industrialization through innovations in textile recycling technologies. However, the successful implementation of circular economy strategies requires a scientific, data-driven approach that goes beyond theoretical sustainability goals. LCIA enables a systematic evaluation of environmental trade-offs, ensuring that CE transitions lead to measurable sustainability benefits rather than unintended environmental consequences. LCIA provides quantitative insights into the sustainability impacts of different production methods, material choices, and waste management strategies. LCIA pinpoints high-impact processes within the textile lifecycle, such as dyeing (responsible for 20% of global industrial water pollution) and polyester production (generating 1.5 kg CO<sub>2</sub>e/kg of fabric). It enables industry stakeholders to prioritize mitigation strategies, such as adopting waterless dyeing techniques or shifting to recycled polyester. Conventional textile production follows a linear “take-make-waste” model, where raw materials are extracted, processed, and discarded. But on the other hand, LCIA allows for the comparison of linear and circular production models, demonstrating how closed-loop systems reduce carbon footprints by 40-60% and cut energy use by 30-50% (Hammar, Peñaloza, Hanning, 2024), (Lozano-Oviedo, Cortés, Rey, 2024). LCIA determines the most sustainable textile materials by assessing factors such as energy intensity, water use, and recyclability. LCIA studies show that mechanically recycled polyester emits 50% less CO<sub>2</sub> than virgin polyester while organic cotton consumes 91% less water than conventional cotton (Periyasamy, Militky, 2019), (Kamble, Behera, 2021).

The objectives of this paper are to analyze how LCIA methodologies influence circular textile decision-making and to quantify the environmental benefits of circular economy textile strategies using LCIA data.

## Literature Review

LCIA evaluates environmental impacts associated with all stages of a product's life cycle, from raw material extraction to disposal. In textiles, LCIA identifies environmental hotspots and informs sustainable practices. A systematic review (Bianco, et al., 2023) analyses studies on LCIA applications in textiles, revealing that the production phase, particularly raw material extraction and manufacturing, contributes significantly to environmental impacts. Cotton cultivation accounts for approximately 90% of water consumption in the life cycle of cotton garments. Additionally, the dyeing and finishing processes are responsible for about 20% of industrial water pollution globally. The paper (Bicalho, et al., 2017) compared LCIA methodologies, highlighting discrepancies in data quality and system boundaries. It found that using site-specific data reduced uncertainty by approximately 10% compared to generic datasets. This shows the importance of accurate data collection in LCIA studies to improve reliability.

The circular economy model aims to minimize waste and maximize resource efficiency by creating closed-loop systems. In the textile industry, circular economy frameworks have been adopted to address sustainability challenges. The review (Ramírez-Escamilla, et al., 2024) analyzed articles on circular economy strategies in the textile sector, identifying reuse, recycling, repair, and reduction as primary strategies. The study emphasized that

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

implementing these strategies could reduce greenhouse gas emissions by up to 30% and decrease water consumption by approximately 50% (Ramírez-Escamilla, et al., 2024). Moreover, the paper (Furferi, Volpe, Mantellassi, 2022) proposed guidelines for textile industries transitioning to circular economy practices, for efficient use of natural resources, adoption of renewable energies, waste reduction, and effective end-of-life product management. Implementing these guidelines could lead to a 20% reduction in production costs and a 25% decrease in environmental impact.

The paper (Edirisinghe, de Alwis, Wijayasundara, 2024) highlights that the textile sector is responsible for 8-10% of global greenhouse gas emissions and 20% of worldwide wastewater pollution. The authors analysed that the most significant environmental impacts occur during the fiber production and wet processing stages. For instance, cotton cultivation in countries like India and Turkey is associated with high water use, pesticide pollution, and soil degradation, scoring up to 10 in environmental significance. Wet processing, particularly dyeing and finishing, is water-intensive and contributes substantially to chemical pollution and energy consumption. Lifecycle thinking and hotspot mapping revealed stages, such as raw material extraction, fabric dyeing, and end-of-life disposal, where circular economy strategies like water recycling, renewable energy adoption, and sustainable farming can be most effective. The paper's qualitative methodology, based on expert input from professionals and guided by UNEP's 2021 Eco-I Manual, offers a practical, low-cost alternative to conventional LCA software for identifying hotspots and proposing targeted circularity interventions across the product lifecycle.

It is important to emphasize that the textile and clothing industry is among the five most polluting and resource-intensive sectors globally, contributing significantly to water pollution and greenhouse gas emissions. While the concept of the circular economy offers a promising alternative to the traditional linear model, its practical implementation remains limited. The paper (Salmi & Kaipia, 2022) found that incumbent textile firms face path dependencies due to legacy product portfolios, product-oriented business cultures, and limited control over supply chains. In their case study of seven Finnish companies, only one was classified as a “circular incumbent,” while others struggled to shift from selling low-cost, short-lived fashion items to service-based or recycled offerings. For example, a company specializing in affordably admitted that its product prices were too low to make rental models viable. Conversely, “born circular” companies successfully used waste materials like safety belts and cutting scraps to drive sustainable design. The paper highlights the importance of dynamic capabilities, such as sensing regulatory shifts, seizing design opportunities, and transforming supply chains, for enabling this transition. It emphasizes that firms with strong internal control and RFID-enabled tracking of garments were better positioned to implement circular business models and reduce waste through repair and reuse strategies.

Applying LCIA methodologies and circular economy frameworks is important for the textile industry, given its substantial environmental footprint. Textile production is responsible for about 20% of global clean water pollution from dyeing and finishing products.

Implementing zero-waste fashion strategies, such as zero-waste pattern design, can significantly reduce the average 15% textile waste generated during standard garment production. Furthermore, adopting circular fashion models, which emphasize designing for

---

longevity, using sustainable materials, and promoting recycling, can contribute to a more sustainable and resilient textile industry.

### **Analysis of case studies**

The following detailed analyses of case studies provide insights into the environmental footprints of different textile products. Bianco et al. (2023) conducted a cradle-to-gate LCA of a woollen undershirt produced in Italy, aiming to identify environmental hotspots in its production process. The study revealed that the total global warming potential of one undershirt is 11.7 kg CO<sub>2e</sub>, with the sheep farming phase contributing 88% of these emissions. Energy consumption during the wool transformation process accounted for 11% of the total emissions, partially mitigated by the use of electricity from photovoltaic panels. Materials such as chemicals and transportation had negligible contributions to the overall environmental impact. The paper highlighted that user habits influence the environmental impact during the use phase of the undershirt.

Cotton Incorporated conducted a comprehensive LCA to evaluate the environmental impacts of cotton fiber and fabric production, covering stages from cultivation to finishing. The study found that producing 1,000 kg of woven cotton fabric requires approximately 8,000 cubic meters of water, with irrigation during cultivation being the primary contributor. The total energy consumption for producing the same amount of fabric was found to be significant, with notable contributions from both agricultural and textile processing stages. These findings underscore the importance of focusing on the cultivation stage to reduce water and energy consumption in cotton textile production (Barnes, et al., 2010).

The paper (Sandin et al., 2024) evaluated the environmental impacts of a garment made from chemically recycled fibers, considering stages from raw material extraction to end-of-life. The study demonstrated that using chemically recycled fibers resulted in a 60% reduction in energy consumption compared to virgin polyester production. Additionally, there was a 50% decrease in global warming potential, equating to a reduction of 2.5 kg CO<sub>2e</sub> per garment. Water usage was also reduced by 70%, saving approximately 150 liters per garment. This case study highlights the environmental benefits of incorporating recycled materials into textile production.

### **Digital tools used for LCA analysis in the textile industry**

LCA software tools are important for evaluating the environmental impacts of products within the textile industry. A comparative analysis of LCA software tools shows the features, strengths, and limitations of this sector (Table 1). SimaPro is the most frequently used LCA software in textile-related environmental assessments. In textile LCAs conducted with SimaPro, a wide range of system boundaries were applied, most notably cradle-to-gate and cradle-to-grave, enabling evaluations from raw material extraction to end-of-life stages. SimaPro supported assessments with standardized units (e.g., kg CO<sub>2e</sub>/kg of material), allowing direct comparisons. For example, in the paper (Fonseca et al., 2023) wool yarn production evaluated using SimaPro revealed a remarkably high global warming potential of 95.70 kg CO<sub>2e</sub>/kg, while silk fabric production showed a similarly high global warming

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

potential of 80.9 kg CO<sub>2</sub>e. Cotton fabric, by contrast, had lower emissions, averaging 14.9 kg CO<sub>2</sub>e/kg of material. In cradle-to-grave analyses supported by SimaPro, polyester showed the highest impact, with an average global warming potential of 40.28 kg CO<sub>2</sub>e/kg, compared to cotton (31 kg CO<sub>2</sub>e/kg) and wool (30.94 kg CO<sub>2</sub>e/kg). These values reflect the broader capabilities of SimaPro to integrate life cycle inventory data, including energy use, raw material extraction, use-phase activities (e.g., washing frequency), and end-of-life treatments such as reuse or incineration. SimaPro's compatibility with diverse impact assessment methods like IPCC, ReCiPe, CML, and TRACI further strengthens its versatility. For instance, TRACI was applied in studies using SimaPro 8.5.2, while ReCiPe and IPCC methods were applied in studies using versions ranging from 7.3 to 9.3. This flexibility enables detailed assessments of climate change impacts, energy demand, and water usage. Overall, SimaPro emerges as a validated tool for LCA in the textile sector, supporting evidence-based decision-making aligned with eco-design and circular economy principles.

The other software tool, GaBi is used in the textile industry to evaluate environmental impacts in different stages of textile production and recycling. In the paper (Sulochani et al., 2022) GaBi version 8 was used to model the environmental footprint of repurposing textile waste into composite materials. This application underscores GaBi's capability to handle complex recycling processes, offering insights into potential environmental benefits of innovative waste management strategies. The paper's findings, supported by GaBi's databases and modeling tools, highlight the software's role in promoting sustainable practices within the textile sector. However, specific quantitative impact values from this study are not provided in the available information. The paper (Dani and Shabiimam, 2024) aimed to evaluate the environmental impact of a textile company's operations. The GaBi 9.2.1 software was used in a gate-to-gate LCA of a Surat-based viscose textile company to evaluate its environmental performance across manufacturing stages, gray cloth production, dyeing, printing, and finishing. Using primary data collected directly from the facility and validated through mass and energy balances, the study revealed that the dyeing process accounted for the highest environmental impact. Dyeing alone contributed 38.04% of total energy demand and 28% of total water consumption, with a global warming potential of 5.37 kg CO<sub>2</sub>-equivalents per kg of product. The weaving and finishing stages followed closely, with global warming potential contributions of 5.382 kg and 5.535 kg CO<sub>2</sub>-eq, respectively. Atmospheric impacts assessed using CML 2001 and Environmental Footprint 2.0 methods showed that the dyeing stage also had the highest ozone depletion potential ( $3.32 \times 10^{-16}$  kg R11-eq) and acidification potential (0.0475 kg SO<sub>2</sub>-eq). Power-intensive sub-processes like thermosetting and jet dyeing were identified as hotspots due to their high steam and electricity requirements. For photochemical ozone creation potential, dyeing contributed 0.0472 kg ethene-eq, followed by weaving at 0.0133 kg. GaBi's weak point analysis module enabled identification of these specific contributors, allowing targeted recommendations such as implementing cool pad dyeing to reduce energy use, installing zero-liquid discharge systems, and adopting renewable energy. Overall, this case study highlights GaBi's capability to model complex textile operations and support strategic environmental management through quantified, process-specific impact assessments.

OpenLCA, an open-source software, has been applied in the textile industry to evaluate environmental and social impacts throughout product life cycles. A case study of an organic

---

cotton hooded sweatshirt produced in India and used in Germany (GreenDelta, 2025a), (GreenDelta, 2025b). The study conducted a cradle-to-grave assessment, encompassing raw material extraction, manufacturing, distribution, use, and end-of-life stages. The findings revealed that the use phase, specifically the washing process, contributed to environmental impacts such as climate change and freshwater eutrophication. Scenarios altering user behavior, like reducing washing frequency or washing at lower temperatures, demonstrated potential for impact reduction. Additionally, a Social Life Cycle Assessment (S-LCA) using OpenLCA highlighted social risks associated with labor practices in the Indian textile sector, emphasizing issues like low wages and extended working hours. These insights show OpenLCA's capability to integrate environmental and social dimensions, aiding stakeholders in making informed decisions to improve sustainability in textile production and consumption.

Ecochain Mobius represents an environmental intelligence platform that enables companies to conduct LCA and measure the environmental impact of their products and processes. In the textile industry, Ecochain Mobius has been employed to assess and improve sustainability practices (Khanna et al., 2022), (Koščáková et al., 2024), (Pamu & Alugubelli, 2023). Dutch textile company, Schijvens Corporate Fashion, used Ecochain Mobius to analyze the environmental footprint of their workwear production. By inputting data related to raw material sourcing, manufacturing processes, transportation, and end-of-life disposal, Schijvens was able to identify significant environmental hotspots within their supply chain. The LCA revealed that fabric production and dyeing processes were major contributors to carbon emissions and water consumption. Armed with these insights, Schijvens implemented strategies such as selecting more sustainable materials, optimizing dyeing techniques, and improving logistics to reduce their overall environmental impact. This case demonstrates how Ecochain Mobius facilitates data-driven decision-making, allowing textile companies to pinpoint areas for improvement and track the effectiveness of sustainability initiatives over time. Similarly, the Belgian textile manufacturer, Beaulieu International Group, applied Ecochain Mobius to evaluate the environmental performance of their flooring products. The platform enabled Beaulieu to conduct comprehensive LCAs, uncovering that the use phase of their carpets had a substantial environmental impact due to maintenance requirements. As a result, the company focused on designing products that required less frequent cleaning and utilized materials that extended the product's lifespan, thereby reducing the overall environmental footprint.

|----------------------|-------------------------------------------------------------|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|

The translation of these insights into actionable strategies requires a multi-level governance and market-oriented approach. In high-impact sectors such as textiles, which contribute nearly 10% to global carbon emissions and over 20% to industrial water pollution, systemic change cannot be achieved through voluntary commitments alone. Therefore, a structured and enforceable policy framework is needed to scale circular practices, institutionalize sustainability metrics, and bridge the gap between assessment tools and industry-wide transformation. At the regulatory level, mandatory life cycle reporting and environmental product declarations should be introduced across textile value chains. Governments can require companies above a certain production threshold to disclose LCIA-based environmental performance indicators for lifecycle stages (e.g., raw material sourcing, dyeing, and end-of-life disposal). This aligns with the European Commission’s Sustainable Products Regulation (2022), which mandates digital product passports and traceability, particularly for textiles. Such regulatory frameworks would improve transparency and comparability across supply chains, incentivizing lower-impact materials and processes. Extended producer responsibility schemes should also be expanded and refined to include LCIA-based benchmarks. For instance, producers could be taxed or subsidized based on their cradle-to-grave environmental footprint. This would encourage design for disassembly, modularity, and the use of recyclable or biodegradable fibres. The LCIA metrics, as outlined in this study, offer quantifiable thresholds for these performance-based incentives. For example, textiles emitting below 20 kg CO<sub>2</sub>e/kg and using less than 4,000 Liters of water/kg during production could qualify for green-labelling or reduced compliance fees. Such economic instruments are vital in levelling the playing field and reducing the cost barriers to circular economy innovation. From an industry standpoint, LCIA provides companies with a strategic lens for eco-design, supply chain optimization, and innovation investment. Firms that integrate LCIA tools like SimaPro, GaBi, or OpenLCA into their R&D pipelines can prioritize raw materials with lower environmental intensity (e.g., mechanically recycled polyester, organic cotton) and identify high-impact production stages. The insights gained through LCIA can guide the development of closed-loop systems, such as take-back programs and fiber-to-fiber recycling, which not only reduce emissions but also open new revenue models (e.g., subscription-based clothing, resale, and remanufacturing). Case studies reviewed in this paper indicate that incorporating recycled fibers can cut GHG emissions by up to 50% and water usage by 70%, making a compelling business case for sustainable innovation. Capacity building and knowledge transfer must be prioritized, particularly for small and medium-sized enterprises in developing and transition economies, which often lack the technical and financial resources to implement LCIA tools. Governments, NGOs, and

---

academic institutions should collaborate to establish LCIA training hubs and develop open-access circular economy toolkits. Policymakers and business leaders must act in concert to institutionalize lifecycle thinking and embed circularity across all levels of the textile ecosystem. This approach is needed for meeting international climate targets, decoupling growth from environmental degradation, and achieving long-term socio-economic resilience.

## Conclusion

This paper provides a comprehensive assessment of how LCIA methodologies support the integration of circular economy principles within the textile industry, in alignment with the United Nations sustainable development goals. The findings demonstrate that LCIA is a critical decision-making tool that enables the identification of environmental hotspots across the textile lifecycle, from raw material extraction to end-of-life disposal, supporting evidence-based sustainability strategies. Quantitative insights from case studies show that transitioning from linear to circular models, specifically through fiber-to-fiber recycling and eco-design, can reduce greenhouse gas emissions by up to 50%, energy consumption by 30–40%, and water usage by as much as 70%. The use of LCIA tools such as SimaPro, GaBi, OpenLCA, and Ecochain Mobius shows their effectiveness in modelling complex processes, validating impact reductions, and guiding product development aligned with circular economy strategies. In addition to environmental benefits, circular economy adoption has socio-economic implications, including the potential to increase employment by 15% in the recycling and upcycling sectors. However, the analysis also reveals challenges in practical implementation, especially among incumbent textile companies facing organizational inertia, technological limitations, and supply chain fragmentation. These findings underscore the need for policy frameworks that incentivize sustainable practices, foster innovation, and enforce extended producer responsibility. LCIA, when coupled with circular economy, offers a scientifically grounded pathway for the textile industry to transition toward low-carbon, resource-efficient, and inclusive production systems that support the 2030 Agenda for Sustainable Development.

#### **Abstract**

Circular Economy (CE) is regarded as a key strategy for achieving climate change mitigation. Applying CE principles in the construction sector is of great importance with regard to the sector's substantial CO<sub>2</sub> emissions. To achieve this goal, it is important to engage the key stakeholders and explore their views on the financial, environmental, social, and policy aspects of CE practices in this sector.

The scope of this study is to identify the perceptions of key stakeholders on the most important barriers for the adoption of CE, and on the strategies needed to transition to a CE in the construction sector. To this end, a workshop entitled “Working with stakeholders on CE practices enhancement” was organized in Brussels in June 2024, bringing together key stakeholders from the research, academic, industrial, and policy areas.

During the workshop, the stakeholders participated in small group discussions, and through a brain-storming process, they identified i) the specifications/requirements of the CE

---

construction products, ii) the barriers against the adoption of CE practices, and iii) the drivers that would help transition towards CE. Then, the stakeholders selected and ranked the most important financial, political, environmental, social, and technological aspects for the above three topics. Based on the above process the most significant specifications/requirements, barriers, and drivers were identified.

The findings of the above methodology revealed that the stakeholders highlight the importance of reducing the prices of CE materials and technology, the need to increase the demand for such products, and the importance of imposing regulatory and financial incentives to enhance CE in the construction sector.

#### **Abstract**

The construction sector, a significant contributor to global resource depletion, waste generation, and carbon emissions, is facing a growing pressure to transition to Circular Economy (CE). This study investigates the dynamics of CE adoption in Albania's construction industry, highlighting the barriers, drivers, and stakeholder roles essential for this transformation. Positioned within the broader context of the Western Balkans, the research addresses the region's unique challenges and opportunities in aligning with global sustainability goals and European Union (EU) standards.

Using a mixed-methods approach, including a systematic literature review, policy analysis, and semi-structured interviews, the study identifies the significant challenges of waste management, recycling, and energy consumption patterns, alongside the opportunities for sustainable development within the Western Balkans. Simultaneously, it explores critical drivers such as economic incentives, advanced technologies, institutional collaboration, and public awareness campaigns that support the sector's transition toward sustainability.

#### Abstract

This paper explores the integration of Circular Economy (CE) principles into higher education systems as a pathway to fostering sustainable development, economic resilience, and climate adaptation in the Western Balkans. The region, encompassing Albania, Kosovo, Bosnia and Herzegovina, North Macedonia, Montenegro, and Serbia, faces significant environmental, economic, and societal challenges, exacerbated by limited awareness, fragmented policies, and slow adoption of sustainability practices. Higher Education Institutions (HEIs) are uniquely positioned to address these gaps by equipping students with the skills and knowledge needed for a green economy and embedding CE principles into curricula, research, and community engagement.

The paper conducts a comprehensive need analysis, focused on selected HEIs within the region, identifying barriers such as a lack of interdisciplinary approaches, educator capacity, and alignment with labour market demands. A strategic framework is proposed to integrate CE into HEIs through curriculum development, capacity building for educators, industry partnerships, and the establishment of CE hubs. The framework emphasizes interdisciplinary learning, hands-on experiences, and collaborations with societal stakeholders to foster innovation and align education with regional and global sustainability goals. To support this transition, this paper will provide policy recommendations for regional cooperation, funding for CE initiatives, public awareness campaigns, and alignment with labour market needs.

**Key words:** Circular Economy, Higher Education, Western Balkans

[m.charitonidou@icloud.com](mailto:m.charitonidou@icloud.com)

#### **Abstract**

The paper focuses on circular economy and novel design methodologies for sustainable housing development and urban linkages. Its point of departure is the hypothesis that the key principle of Sustainable Development is ecosystem conservation. It will investigate methods conserving the ecosystem and biodiversity because living organisms will cease to exist without these. The engagement of community-based organisations, savings and building groups, or small-scale housing cooperatives is also essential for supporting identity formation, social cohesion, empowerment and shared ownership. In the framework of this paper, a unified theory of the built environment will be formulated. The built environment will be understood as a complex social-ecological system where multiple related metabolisms interact at different scales. Particular emphasis will be placed on analysing the methods of regenerative design, considering that a key notion in regenerative design is the co-evolutionary, partnered relationship between socio-cultural and ecological systems. Regenerative design embraces ‘place’ as the fundamental foundation for design, fostering a connection between people and the spirit of that place, which energizes them and instills a genuine motivation to nurture it. Regenerative design is based on acknowledging the complex and continually evolving interrelationship between socio-cultural and environmental systems and reorientating the understanding of the role of building within this changing context. At the core of this paper is the analysis of the distinction between green and regenerative approaches to design. A digital twin is a digital representation of a physical environment that collects real-time data. Nowadays, urban-scale digital twins are used during the decision-making process in urban planning to test scenarios concerning their impact on the circular economy and sustainability. The paper also examines how digital twin–circular economy integration makes it effective for construction to overcome circular economy barriers or challenges, reduce waste, and increase salvage value. It places particular emphasis on the following 5R principles: (1) Rethink, which targets the maximum efficiency of resource utilisation through innovation; (2) Reduce, which targets the minimum usage of resources through production and consumption; (3) Reuse, which targets the maximum usage of a product through relocation or resell; (4) Repair, which targets the maximum lifespan of a product through repair and maintenance; (5) Recycle.

**Key words:** circular economy, regenerative design, place, urban-scale digital twin, adaptive reuse

## **Abstract**

The leading global challenge is achieving the UN Sustainable Development Goals (SDGs) for a more sustainable and inclusive world by 2030. Architecture may sufficiently contribute to this. In particular, buildings and open spaces that respond to citizens' evolving needs, even in extreme conditions, lead to higher social resilience. Therefore, the efficient management of these issues enforces sustainable growth for the benefit of all stakeholders and should be a target.

Based on experts' perspectives in Greece, the present study examines the impact of buildings and open spaces on social resilience.

A hybrid focus group discussion was conducted, with half of the participants meeting in a classroom and the other half joining via Zoom. Ten (10) experts from diverse and relevant to the examined issue fields, each with extensive experience, engaged in in-depth discussion.

The study's main findings highlighted the importance of architecture and its contribution to sustainable development. Well-designed buildings and open spaces that effectively meet citizens' needs in regular and challenging conditions are essential for enhancing well-being, fostering social interaction, and building resilience. Renewing old buildings and industrial areas may offer valuable services to local communities. A more holistic and proactive approach with the participation and collaboration of all stakeholders should be applied to manage crises better. It is essential to consider the needs of minorities in the design and use of infrastructure. The study is limited as it focuses solely on Greek participants, which introduces bias in their perceptions and may not represent a broader perspective.

**Keywords:** Sustainable Development Goals, social resilience, sustainable architecture, sustainable buildings, open spaces, extreme events, sustainability in Greece.

---

### Introduction

Addressing current global challenges necessitates contributions from individuals, communities, and governments alike. ‘The 2030 Agenda for Sustainable Development’ outlines 17 Sustainable Development Goals (SDGs) that form a crucial global framework. Developed and developing countries must unite in a strong partnership to implement strategies that enhance health and education, eradicate inequality, drive economic growth, protect the environment, and ensure the successful attainment of these targets (UN, nd). The social targets play a crucial role in fostering progress and positive change. Social resilience achievement, including the community's capacity to sufficiently respond to various challenges, is vital. According to Adger (2000), social resilience is defined as “*the ability of groups or communities to cope with external stresses and disturbances as a result of social, political, and environmental change*” (p. 347). Thus, the social, political, environmental, and economic aspects are related, and their efficient management leads to social resilience. Keck and Sakdapolrak (2013) pointed out the following three essential parts to achieve social resilience: a) coping capacities of social actors to cope with and solve all kinds of problems; b) adaptive capacities, using their ability from their experience and adjust their actions to handle future challenges in their daily lives successfully; and c) transformative capacities to equip institutions with the required resources to improve ‘individual welfare’ and achieve sustainable societal robustness to manage future crises successfully. Therefore, achieving social resilience benefits all stakeholders, and the appropriate tools are critical. Architecture plays a key role in designing cities, including buildings and open spaces that are friendly to citizens, considering possible adverse events and uncertainty from climate change. Adaptive reuse architecture (or building reuse) renovates old buildings into new use, mainly from real estate businesses that have the financial resources and expertise is essential (Master Class, 2021). Among the stakeholders in this effort, the role of individual citizens and personal and societal growth are crucial to achieving SDG progress. Inner development is critical to social resilience; it concerns personal development in a ‘sustainable future’ and requires a holistic transformation (Meridian University, 2024). Adopting a more holistic and proactive approach with the involvement of all stakeholders to improve daily life and successfully respond to uncertainty is imperative. Also, digital technologies provide early warning information, optimise resource distribution, and facilitate remote collaboration, all of which are important to mitigate inequalities and successfully handle extreme events (Vincent & Cull, 2014).

This paper explores how architecture contributes to building sustainable social resilience. It highlights the necessity of integrating social, economic, environmental, and institutional elements to promote adaptive architecture. To effectively promote sustainability and address extreme physical events with significant social, economic, and ecological impacts, buildings and open spaces must be designed and utilised with maximum efficiency.

The current study followed a hybrid focus group where half of the respondents met in a classroom, and the rest participated through Zoom services. Ten (10) experts, mainly from the social and architectural fields, discussed the above issues and generated beneficial outcomes.

The study's main findings proved the importance of architecture and, in particular, the design and use of buildings and open spaces in achieving social resilience, which leads to progress in achieving SDGs. Towards this, the active involvement of all stakeholders,

---

particularly individual citizens, through profound awareness and personal growth is recommended. In addition, a more holistic and proactive approach is required to manage crises better. There should be greater emphasis on regenerating old buildings and repurposing unused industrial areas. Although the study participants had extensive knowledge of the subject, their concerns were primarily local, as they were based in Greece and requested to focus mainly on locally relevant issues.

### **Literature review**

This section of the paper briefly outlines the fundamental issues surrounding the study of social resilience and architecture.

#### ***Social resilience***

Social resilience assists people in sufficiently responding to external shocks, stress, and stressors (Kwok et al., 2016; resiliencelinks, nd). It contributes to the phases before, during, and after the disaster through preparedness, response, and recovery, and its main attributes are the community gathering place, social support, risk awareness and impact, collective efficacy, and a strong community sense (Kwok et al., 2016). In addition, human capital (skills and knowledge), social capital, psychosocial dynamics (self-efficacy, aspiration, and confidence), and social protection are important elements of social resilience (resiliencelinks, nd). The involvement of several organisations at global, national, and local levels is required to address community vulnerabilities, enforce social networks, and build capacity to handle economic, social, and environmental challenges efficiently. At the top level, the ‘Sendai Framework for Disaster Risk Reduction 2015-2030’ supported by the United Nations Office for Disaster Risk Reduction (UNDRR) set ambitious goals to minimise disaster risk globally by providing the required support to countries (UNDRR, nd). Next, governments play a key role in promoting resilience by applying the proper policies, efficiently allocating available resources, and supporting systems that assist communities to withstand and handle emerging challenges. The government increasingly operates as an enabler in cases of emergency, mainly coordinating other actors and less directly intervening to control the situation. At the same time, many responsibilities are increasingly moved to local communities and individuals (O’Grady & Shaw, 2023). Local communities are fundamental in minimising vulnerability and achieving community resilience as the first response line. Their active involvement, local knowledge, and social networks are vital for building adaptive capacity and enforcing sustainable development (UNDDR, nd). Finally, individuals acting independently can be prepared to efficiently manage extreme situations like educating their children or keeping the roads safe. Individual resilience is closely associated with the community’s ability to prepare, adapt, and respond to extreme events (Norris et al., 2011). The coordination of these three levels and the clear responsibilities to successfully manage external extreme events are critical. The term ‘responsibilisation’ as a process that facilitates the responsibilities’ shift from state to individuals and communities is widely used (van Bommel & Höffken, 2021). The willingness and capabilities of the local actors to manage and support ‘certain responsibilities’ and whether these are the appropriate ones are critical (Mustalahti et al., 2020).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The social dimension of resilience and emphasis on social factors for recovery is essential. Thus, social networks, social groups, and their relationships play a key role in how communities “*plan for, adapt, and recover from crisis or climate disaster*” (resiliencelinks, nd). The elements that support social resilience at individual and group levels are the following: information and advice, resources, management capacity, personal and community support, and higher involvement. In the broader context of community support, this can be provided by the following: high knowledge of hazards, shared community values, establishing functional social infrastructure, positive social and economic trends, good partnerships, sufficient resources, and competent skills (Buckle, 2006).

Therefore, individuals' and local communities' role in successfully handling extreme events and contributing to social resilience is vital.

The continuous assessment of the community's resilience to find weak points, improve them, and analyse various relevant factors that show how individuals, groups, and systems respond to extreme events are highly required. It is recommended to use indicators that encompass physical (such as buildings and infrastructure), social, and economic systems (such as the natural environment), as proposed by the assessment methodology (NIST, n.d.). Below are the most important indicators presented.

Social Vulnerability Index (SVI) is a web-based mapping tool that measures social vulnerabilities and assists communities in managing these (Bureau of Transportation Statistics, nd).

**The Resilience Analysis and Planning Tool (RAPT) is a GIS-based mapping mechanism that uses over 100 preloaded layers and was developed by the Federal Emergency Management Agency (FEMA).** RAPT aims to assist everyone in understanding its communities, providing information on population demographics, community infrastructure, hazards, and other related issues (FEMA, nd).

The PEOPLES is a multi-dimensional, holistic framework for defining, assisting, and enhancing communities' disaster resilience. It focuses on the following seven dimensions of resilience represented by the acronym PEOPLES: Population and Demographics, Environmental/Ecosystem, Organized Governmental Services, Physical Infrastructure, Lifestyle and Community Competence, Economic Development, and Social-Cultural Capital. Combining the above-mentioned dimensions, this framework can be the basis for developing quantitative and qualitative models that may continuously measure the communities' resilience (Renschler et al., 2010).

**The Baseline Resilience Indicators for Communities (BRIC) framework** was developed by the University of South Carolina's Hazards & Vulnerability Research Institute and aims “*to assess attributes of resilience to natural hazards*” at the country level and applied initially in the USA and then to other countries. The BRIC uses 49 variables grouped in the following six dimensions: **human well-being/cultural/social, economic/financial, infrastructure/built environment/housing, institutional/governance, community/capacity, and environmental/natural** (University of South Carolina, College of Arts and Science, nd).

**In addition, the relevant literature proposed more resilience assessment tools such as the Community Resilience Measurement Tool (CRMT), the Community Resilience**

## PROCEEDINGS

---

### **Index (CRI), the Climate Disaster Resilience Index (CDRI), the Disaster Resilience of Place (DROP), etc.**

Identifying disaster phases and applying specific actions to improve the situation is essential. In particular, in the phases of reduction, trying to minimise risk and disaster consequences, readiness developing operational capacity, and preparing to handle unusual conditions, response emphasising the protection of lives and infrastructure, and recovery coordinating efforts on a holistic regeneration and improvement of a community (National Emergency Management Agency, 2020).

The governance of social resilience is a fundamental issue, ‘complex and often multidirectional’, and as governance ‘super factors’ are mentioned, the “*control of corruption, societal trust, and high-quality political leadership*” (Brown, 2022). The governance of disaster management, particularly the coordination, arrangements, and processes concerning all the involved actors and the proper decision-making, are critical (Tierney, 2012). Finally, gender equity, broad inclusion of young people and minorities, appropriate infrastructure such as public spaces and parks serve the recreation and cultural purposes, and community institutions are essential for social cohesion that creates resilience (resiliencelinks, nd). Architecture must be prioritised because it is crucial for creating a sustainable environment.

### ***Architecture and Social Resilience***

The role of architecture in creating a sustainable built environment, social cohesion, and resilience is excellent. The recent pandemic showed the importance of the management of buildings due to the time people spend in these and their impact on their health and well-being (Lipinski et al., 2020). “*By designing buildings and public spaces that encourage social interaction, community engagement, and a sense of belonging, architecture can contribute to the well-being of individuals and society as a whole*” (De Burca, 2023). The built environment facilitates people's connection, adaptation, and recovery. Understanding the relationship between buildings, spaces, and people is critical. The first two issues' design and use impact people's interactions, behaviours, and experiences, creating collaboration and mutual support opportunities (Larsen, 2013). In addition, implementing practical, proactive, and tailor-made policies and practices that meet people's needs is essential (Barham, 2017). Importantly, offering buildings and environments that promote people's well-being is vital. Rashidfarokhi and Danivska (2023) highlighted the following factors that facilitate well-being: a) socio/demographics, b) material living conditions (income, wealth, housing, education, access to services, etc.), c) psychological traits, d) physical and mental health, e) meaning of life, f) security, and g) connectedness. These issues should be considered when designers and policymakers construct buildings, neighbourhoods, open spaces, and cities. Architecture and style in buildings and spaces at individual and community levels, neighborhood distinction, street width and layout, green spaces, house distance to street, parking areas, porches, flexible space, and layout are all essential. Apart from well-designed buildings, offering clearly defined gathering places such as schools, squares, local businesses, and other community centres is a critical issue that creates social capital, enhances community connection, supports disaster response and recovery, and actively reinforces the ‘social fabric of communities’ (Kwok et al., 2016). Those places should be designed considering community needs and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

aspirations, and the close collaboration and engagement of architects, community members, and other stakeholders is essential (De Burca, 2023).

Sufficient urban spaces such as healthcare services, cultural and religious facilities, recreational and civic centres, improved infrastructure and accessibility (suitable street design, availability of walkable areas, good public transportation, and pedestrian-friendly services), technical infrastructure (availability of the proper technology, access to the valuable services such as water, air quality, wastewater management, solid waste management, view daylight cycles, easy contact with the nature and views of natural scenery), and functionality and aesthetics (ergonomics, used colours, decor, and fabric and materials) are all important (Rashidfarokhi & Danivska, 2023).

Therefore, special emphasis should be placed on the building and open spaces design to serve better people's needs in regular and extreme conditions. Community social resilience is focused on satisfying the needs and aspirations of the community's members “*to create sustainable and resilient architecture*” that contributes to social cohesion. The two concepts can be integrated to provide substantial sustainability benefits to the community. The following strategies facilitate community resilience: a) sustainable design that supports social, economic, and environmental resilience, b) multi-functional spaces that facilitate social cohesion and community engagement, and c) disaster preparedness that creates resilient structures to natural and human-made extreme events (De Burca, 2023).

The eight fundamentals of ‘Resilient and Climate Adaptive Design’ to minimise harm and possible property damage and better adapt to evolving conditions must be “*place-based, risk prepared, equitable, precautionary, system-centric, ready, service-life focused, and adaptive*” (AIA, nd).

The specific characteristics of each area should be considered, as the requirements in cities and rural areas in architecture and social resilience differ. More than half of the population currently lives in urban areas (4.52 billion is the urban population, and 3.43 is the rural population), which is increasing. Specifically, in high-income countries (Western Europe, America (USA and Canada), Japan, and the Middle East), more than 80% of the population lives in urban areas; in most upper-middle-income countries (Eastern Europe, East Asia, North and Southern Africa and South America) between 50% to 80% of people live in urban areas. In low-income countries, many people live in rural areas (Ritchie et al., 2024). Architectural solutions provided in an urban context require more density, innovation, and efficiency, and those in rural areas are focused on tradition, sustainability, and higher integration with nature. In both areas, buildings and open spaces should be created that enhance people's well-being and resilience and mitigate risk from extreme events.

The emphasis on sustainability in buildings and open spaces designed to endure extreme events is essential for a resilient and responsible future. Sustainable and regenerative designs are two interrelated approaches that promote environmental protection, social growth and well-being. ‘Sustainable design’ is focused on creating products, buildings, and systems that consider energy efficiency using renewable energy sources, environmentally friendly materials, waste management, and social responsibility, where the following design is adjusted to human needs and facilitates social justice. ‘Regenerative design’ is looking to regenerate natural and social resources. Its four main elements include the restoration of the ecosystems that promote natural vegetation and biodiversity, autonomy supporting the local

---

economy and minimising dependence on external resources, the circular economy emphasising efficient waste management, and social participation encouraging the involvement of communities in the decision-making and design processes (Hariramet al., 2023).

The active involvement of minorities in the achievement of social resilience is a critical issue. They have specific needs that should be respected in buildings and open spaces design. Disabled people are the largest minority group in the world population, and over 1.3 billion people live with some disability. In addition, over 20% of the population will be over 65 by 2050 (WHO, 2021). These people require adequate support from other stakeholders, mainly governments, and a more holistic approach to achieving higher inclusion and participation (Poli & Malagas, 2024). Also, other minorities, like children, immigrants, tourists, etc, should participate in daily social life. Architecture must prioritise the design of buildings and open spaces that meet all citizens' needs while proactively addressing the challenges posed by extreme events. Effective urban design that emphasises inclusivity, safety, and flexibility may assist communities to thrive against crises and challenges.

## Methodology

Qualitative research was applied in the current study, and it is an exploratory approach that examines people's experiences, perceptions, social phenomena, and cultural meanings using non-numerical data (Creswell & Poth, 2018). It introduces the observer to the real world and makes it visible (Denzin & Lincoln, 2018). The main qualitative methods used are interviews, focus groups, textual analysis, and observations to gain in-depth analysis of a specific issue.

In particular, the focus group method was used in the current study. This is a non-standard technique of information gathering based on apparently informal discussion and interaction among a group of people, where the role of a moderator, who is mainly the researcher and leads the discussion, is critical (Acocella, 2012; Morgan, 1997). The hybrid focus group discussion was implemented as half of the participants were in the same room discussing the examined issue, and the other half were discussed through Zoom services. The discussion meeting lasted more than three (3) hours and took place in the Department of Interior Architecture, University of West Attica, in Athens, Greece. The discussion focused on Greek reality but presented some general related perspectives. Ten (10) experts from various relevant fields discussed the examined issue. The participants' jobs were a Social Science Professor, an Architecture Professor, a Manager from Civil Protection, a Sociology Professor, a Major from a Big City, a high ranked Manager of Attica Prefecture, a Firefighting Commander, a Sociologist, a Manager of Public Health Services, and a disabled people. All the participants had a rich experience in the examined subject. The first author of the study was the discussion moderator. Initially, the moderator presented the examined subject in detail, while ten (10) days before the discussion meeting, all the participants received an email with the study's details and objective.

---

### The Outcomes of the focus group discussion

All the study's participants initially agreed that architecture and built environment significantly contribute to higher social resilience. Buildings and open spaces should consider citizen needs, respect the environment, encourage social interaction, promote well-being, and protect people from extreme events. In Greece, the fundamental issues concerning people are related to climate change, such as water scarcity, floods, and fires, while efficiently handling earthquakes is critical. Improvements in water and waste management are proposed. The use of fire-resistant materials in buildings and open spaces construction in areas near forests is critical. In addition, implementing zoning policies that restrict construction in high-risk areas and promote green buffers can help the creation of safer urban landscapes. They emphasised that more efforts are needed to raise awareness and create additional neighbourhood open spaces.

An efficient and effective governance and proactive action are required to handle the above-mentioned issues. Adopting a more holistic approach with the active participation of all stakeholders, such as government, local communities, research institutions, and individuals, is essential. The high participation of individuals in decision-making and problem-solving processes is imperative. The unambiguous assignment of roles and responsibilities is important, as there are cases in which central government, regional/prefectures, and local municipalities are in conflict to handle specific cases. The continuous training of leaders and citizens is vital. The **timely provision and dissemination of critical information** regarding crisis management, business operations, public health, and governance are essential. Through these, the various stakeholders may make informed decisions, respond quickly, achieve higher involvement, and minimise risks.

A big city's Mayor mentioned the importance of regenerating old buildings and unused industrial areas to offer valuable services to local communities.

The Social Science Professor pointed out that the greater use of technologies such as Artificial Intelligence (AI) and big data is vital, as these contribute to higher information circulation and prediction of some extreme events.

The Manager of Public Health Services emphasised strengthening healthcare infrastructures and workforce preparedness and more in primary health services. Telehealth services are essential to healthcare delivery, especially after the COVID-19 pandemic, significantly contributing to their adoption. It assists in providing remote patient care, improving patients' convenience, access, and efficiency, and minimises health system strain and cost.

The disabled person pointed out that minorities like the disabled community have specific needs that should be taken into account in **urban planning, architecture, and infrastructure design**. The design of buildings and open spaces must respond to disabled people's requirements. Inclusive design, where buildings and open spaces are fully accessible and functional for everyone, mainly for those with disabilities, is essential.

### Discussion and Conclusions

In the last years, economic crises, energy problems, pandemics, wars, earthquakes, and events related to climate change have occurred more often. Architecture and the built environment

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

are related to these extreme events, require proper design innovation, and substantially contribute to the enforcement of social resilience (AIA, 2023). Therefore, particular emphasis should be placed on the design of buildings and open spaces to facilitate social interaction, well-being, and environmental protection, contributing to better handling of crises.

The active involvement of citizens in the built environment design, decision-making, and problem-solving processes facilitates a sense of ownership and empowerment. The regular feedback and assessment of the various infrastructures should be applied. Towards this, workshops, focus groups, and ‘design charettes’ are essential to achieve feedback and collect and incorporate ideas from residents (De Burca, 2023). The timely circulation of critical information for effective reaction, enhancing collaboration, risk mitigation, and public safety is vital. In this vein, applying digital communication platforms, AI, the Internet of Things (IoT), and robotics significantly improve recovery and disaster preparedness.

Social networks are more significant than formal humanitarian aid (resiliencelinks, nd). Thus, emphasis on the identification and efficient use of informal and formal social networks that facilitate quick reactions in extreme events is essential. In designing buildings, open spaces, and infrastructure to successfully handle crises, adopting a more holistic and proactive approach with the active participation of all stakeholders, such as governments, local communities, universities, and individuals, is recommended. Buildings and open spaces must enforce social interaction and well-being, mitigate risk, and protect all in extreme situations. Renewing old buildings and unused industrial areas to benefit local communities by supporting sustainable development and economic growth and preserving heritage is also critical. These infrastructures' adaptive reuse and restoration to revitalise urban and rural areas and meet the citizens' current and future needs are important. The extensive collaboration of public and private organisations to promote social resilience through sustainable architecture is recommended. Also, effective waste and water management significantly impacts the health of communities. Public buildings may strengthen social resilience by supporting community needs, emergencies, and social interaction. Well-designed and adaptive public spaces may assist communities to **withstand, recover from, and adapt to challenges** such as natural disasters, economic downturns, and social disruptions. The higher involvement of the neighbourhood in daily social life is recommended (Purdue, 2001).

Hospitals and primary health services must be prepared to handle extreme events efficiently, and the recent pandemic provided helpful guidance. Also, buildings and open spaces must sufficiently respond to the specific needs of minorities. Disabled people are the highest minority group and must equally participate in daily social life, and the offered infrastructure may respond to those people's needs. Tourists, immigrants, Romani, and other minorities also having diverse needs must be included in the provided services.

The efficient implementation of architecture in buildings and open spaces is related to higher social responsibility and more or less to the achievement of several United Nations sustainable development goals (SDGs), such as good health and well-being (SDG 3), gender equality (SDG 5), clean water and sanitation (SDG 6), affordable and clean energy (SDG 6), sufficient industry, innovation and infrastructure standards (SDG 9), reduced inequalities (SDG 10), sustainable cities and communities (SDG 11), responsible consumption and production (SDG 12), improved life on land (SDG 15), and partnership for the achievement of these goals (UN, nd).

## PROCEEDINGS

---

Conclusively, the active participation of all stakeholders in designing and using buildings and open spaces to accommodate all citizens' needs and respond to extreme events is imperative. Individuals must be aware of all relevant issues, have enough training, and receive the proper governance to contribute more to social resilience. Unexpected events have distinct characteristics that demand specific actions and policies. All stakeholders must stay well-informed about these issues and take proactive measures. Resilient design in high-risk areas requires specific architectural design and materials that can withstand natural disasters. Therefore, the future of architectural resilience is bright, with more developments in areas such as sustainable materials, innovative technology, viable reconstruction, and adaptive reuse of old buildings. With these advancements, we can create buildings that are not only attractive and functional but also robust and resilient in the face of unexpected challenges.

### Limitations of the current study and suggestions for further research

The current study presents significant limitations as all the participants are based in Greece, and their perceptions mainly concern the Country. Thus, the generalizability of the study's outcomes is limited. Also, more in-depth qualitative and quantitative approaches to gain more insights are recommended.

#### Abstract

There are regions that have a combined maritime and territorial space, there are various risks that threaten the local society, economy and market, due to climate change, technological or natural disasters or other dangerous situations. In such cases, there is a need for technological tools to prevent, manage and reduce risks, while at the same time requiring low costs in order to be accessible to an increasing number of local communities. Thanks to the fourth industrial revolution, which includes emerging and disruptive intelligence and information technologies (artificial intelligence, Big data, the internet of things-IoT, autonomous vehicles, robots, 3D printing, 5/6G, etc.), there is now the potential to dramatically affect economic, social and environmental sustainable development. In addition, new capabilities in data collection, processing & analysis are offered, while correspondingly, capabilities in autonomous observation, surveillance and intervention systems have increased thanks to autonomous vehicles (UxVs).

The aim of this work is to highlight the value of unmanned vehicles of all types (UAV, UGV, USV, UUV), while utilizing swarm technology in emergency management in a local community that includes marine and territorial space, based on the use of renewable energy sources. The goal of such an application will be the early detection of events hazardous to the local society, economy and environment, their management with the ultimate goal of reducing the potential impacts.

**Keywords:** UxVs, swarm, emergency management, urban areas

### Abstract

In view that cities will continue to house the majority of the world's population at an increasing rate in the face of climate change, this paper studies urban and community resilience by examining the response history of the mean-square displacement of the citizens of large cities and smaller communities prior to and upon historic natural hazards strike. The recorded mean-square displacements of large numbers of cellphone users from large American cities that were struck by recent hurricanes suggest that large cities of average to high population density when struck by natural hazards exhibit a remarkable inherent resilience. The recorded mean-square displacements presented in this study also validate a mechanical model for cities, previously developed by the authors that is rooted in Langevin dynamics and predicts that, following a natural hazard, large cities revert immediately to their initial steady-state behavior and resume their normal, pre-event activities.

#### **Abstract**

In recent years, climate change has become more and more noticeable as weather conditions are hazardous to human life and settlements. As a result, cities and their municipal authorities need to deal with the various risks related to natural disasters that are enhanced by the pressure of urbanization. The European Union (EU) and the United Nations (UN) are leading the states to such a resilience-oriented planning policy focusing on promoting environmental,

---

social, economic and technological sustainability in terms of preventing a disastrous effect and restoring the damages during the post-crisis period.

In this context, this paper focuses on floodings which are a type of environmental crisis that affects local economy and society. The regional unit of Magnesia has been selected as a case study as its northern part has been vastly effected by a flood during 2023 and a series of socio-technical problems have been emerged. Based on this case study, we have tried to identify the causes that have led to this crisis in order for an action plan to be formulated to (a) improve the resilience level of the area and (b) draw conclusions in developing ideal strategies that eliminate the effects of flooding phenomena. To gain this goals, a comprehensive analysis of the study area has been implemented; more specific, geomorphology, residential networks and urban form of settlements, technical and social infrastructure as well as environmental characteristics have been examined. Following an assessment process, based on the SWOT analysis method, an action plan has been proposed.

Finally, conclusions came to the fore including directions for spatial planning process while the role of specific planning tools, like the Special Urban Plans (SPP), has been critically appraised.

**Key words:** climate crisis, flooding risk, urban resilience, Magnesia, SWOT analysis.

#### **Abstract**

Floods are among the most catastrophic events for contemporary cities, impacting populations, economy and infrastructure while highlighting the urgent need for mitigation and preservation strategies. For historic cities with significant cultural heritage, the need for preservation is even more critical.

This paper aims to examine flood risk management strategies for historic cities, which are highly vulnerable to natural phenomena such as floods that are increasing in frequency and intensity due to factors such as climate change and urbanization. Through a systematic literature review of 70 case studies and relevant theoretical contributions, it categorizes the key causes of flood risk into natural, anthropogenic, endogenous, and systemic factors, emphasizing the complex interplay among them. The paper then evaluates a broad range of flood risk management strategies, including structural and technological solutions, policy integration, blue-green infrastructure, and community-based approaches.

It highlights how successful resilience planning requires not only technical innovation but also cross-sectoral cooperation, local knowledge, and inclusive governance. The findings advocate for a multidimensional, place-based approach that balances risk mitigation with the preservation of cultural identity, supporting sustainable development in heritage-rich cities facing increasing climate-related threats.

**Key words:** Historic Cities, Flood Risk Management, Cultural Heritage, Climate Change, UNESCO World Heritage Sites

#### **The Rising Threat of Floods in Heritage Urban Landscapes**

Floods have been one among the most devastating natural hazards, that affect contemporary cities on multiple levels: population, economy and facilities. In the case of historic cities, urban areas that are recognized for their historical, cultural, and architectural value, the threat is even greater. Those cities typically contain well-preserved heritage sites, such as ancient monuments, historic buildings, and cultural landscapes, reflecting their historical importance, that are particularly vulnerable during and after the floods. Last decades, the intensity and

frequency of those flood phenomena have been increased due to climate change, and rapid urbanization that has led to an artificialization of the natural ground. This situation requires modern, innovative techniques of preservation and restoration for both historic and non-historic cities.

This paper explores management strategies for flood risk in historic cities, in order to highlight best practices and technologies that could ensure sustainable development and adaptation to this increasing threat while preserving the cultural identity of those places.

**Literature Review and Data Analysis: Methodological Approach, Case Selection, and Geographic Trends**

The data collection was conducted using various academic publishing platforms, including MDPI, ScienceDirect, Taylor & Francis Online). Keywords such as “historic cities” and “flood risk”, were used to identify studies that explore the concept of historic cities and flooding.

The following criteria were applied in order to include the papers in the meta-analysis: thematic relevance was the primary factor, with priority given to studies focusing on vulnerability, impacts, and flood risk management in historic areas or cities. Language and availability were also key considerations, as only papers that were fully accessible for review and written in English were selected to ensure consistency in the analysis.

According to these criteria, a sample of 70 cases was selected for the state-of-the-art analysis.

*Table 1 Number of analysed papers per year (2003-2024)*

As shown in Table 1, the number of analyzed published papers per year shows a clear increase in recent years, particularly over the last decade. This trend is mainly attributed to the overall rise in academic publications across research databases, driven by the growing frequency and severity of flood events due to climate change. At the same time, the urgency

to protect and preserve cultural heritage has become more urgent and well known. Additionally, technological advancements in the past decades have become indispensable tools for flood risk management, enabling more accurate analyses and assessments. As a result, more recent publications are often more relevant to current challenges and methodologies, which justifies their prioritization in this review.

Table 2 Most frequently examined sites

Table 3 Geographic distribution of case studies

The vast majority of the reviewed papers -87% (61 out of 70)- focus on specific case studies, while the remaining publications adopt a more general, theoretical approach to flood risk and heritage preservation, without reference to particular locations. The most frequently examined sites (Table 2) include Ayutthaya in Thailand (6 mentions), Florence in Italy (4 mentions), and Venice, Genoa (Italy), and Corfu (Greece) with 2 mentions each.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Among the selected case studies, nearly half (31 papers) focus on areas that are either entirely UNESCO World Heritage Sites or include such sites. More specifically, 18 papers examine cities whose historic centers are officially named as UNESCO World Heritage Sites (Florence, Rome, Krakow, Prague, and more), while 13 analyze monuments or areas that belongs to UNESCO-listed sites (Athens, Seville, Valencia, Nicosia, and more).

Regarding geographic distribution (Table 3), the 61 case study papers show a notable concentration in Europe (37 papers), followed by Asia (17 papers). The remaining publications are spread across other continents, with each contributing between 1 and 4 papers. This reflects probably the high density of ancient cities with rich architectural, cultural, and archaeological heritage in Europe and Asia. It also indicates a stronger governmental and institutional prioritization in these regions toward the preservation of cultural heritage, supported by broader access to research data, often through open-access platforms. Additionally, many European historic cities were originally established near rivers or coastal zones for strategic trade and defense purposes, which today contributes to their heightened vulnerability to climate change-related flood events.

### **Flood Risk in Historic Cities: A Literature-Based Categorization of Vulnerability Factors**

Historic cities are increasingly facing flood risks due to a combination of internal and external factors. Table 4 presents the most frequently cited factors across the analyzed papers, with the most common being increased rainfall, poor or insufficient urban planning, outdated infrastructure and drainage systems, natural topography, and urban expansion or high-density development.

For the purposes of this analysis, the paper categorizes these factors into four main groups: natural, endogenous, anthropogenic, and systemic. While examples of each category appear in the majority of the reviewed literature, it is the interaction and overlap among them that truly defines the current flood risk in historic urban environments.

Table 4 Mentions of Flood-Related Factors Across Case Studies

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### **Natural factors: Climate Change and Environmental Conditions**

Natural factors refer to environmental and climatic conditions beyond human control that contribute to flood risk—such as heavy rainfall, sea-level rise, and geological processes. Among the 70 reviewed papers, 57 identify increased rainfall as a key factor of flood vulnerability in historic cities.

A major contributor to these natural hazards is climate change, which is intensifying both the frequency and severity of extreme weather events. It is cited in 34 papers as a main factor behind more intense rainfall patterns and long heatwaves. These heatwaves dry out the soil, reducing its ability to absorb water and thereby increasing surface runoff during heavy rain event. (Brokerhof et al., 2023; Cisse et al., 2022; Gizzi and Porrini, 2017; Porębska et al., 2019)

Climate change also provokes rising sea levels, due to the thermal expansion of seawater and melting polar ice caps. According to the Intergovernmental Panel on Climate Change (IPCC), global mean sea level rose by 17 cm over the twentieth century and keeps rising at an accelerating rate. (IPCC, 2022) This rise threatens places and World Heritage sites that were not previously vulnerable and can also raise river levels -such as the Thames in London or the Liffey in Dublin)- leading to significant loss and transformation of their cultural landscapes (Gruber, 2008; Nicolini, 2024; Perez-Alvaro, 2016)

Venice is an interesting example where natural factors are the primary cause of flooding, as the city was built at low elevation within a shallow lagoon, making it especially susceptible to high water events (locally called ‘acqua alta’). (Balan and Bordelon, 2021; Giupponi et al., 2024; Gruber, 2008; Indirli et al., 2014) Despite centuries of engineering efforts to manage acqua alta, Venice still faces severe flood risks due to rising sea levels (from climate change-driven thermal expansion and melting ice), compounded by local subsidence caused by tectonic activity, sediment compaction, and past groundwater extraction.

Similarly, New Orleans is naturally vulnerable to flood events due to its natural position of low altitude near the Mississippi River and the Gulf of Mexico. It is exposed to rising sea levels, land subsidence, and coastal erosion, which together amplify its flood risk. (Balan and Bordelon, 2021; Genova et al., 2020).

### **Anthropogenic Factors: Urbanization and Poor Water Management**

Anthropogenic factors refer to those related to human activities or decisions that have directly or indirectly increased flood risk over the years. Urbanization and land use changes have significantly affected the vulnerability of historic cities to flood events.

Urbanization is considered as a critical factor in many papers (identified in 42 papers), as it often leads to reduced green areas that would normally absorb rainwater (mentioned in 9 papers). More specifically, many studies underline how the artificialization of zones has often led to the loss of natural land barriers -such as wetlands, mangroves, or floodplains- which previously helped absorb or slow down floodwaters. (Balan and Bordelon, 2021; Thanvisitthpon, 2019) In Florence the growth of impervious surfaces because of artificialization reduced the natural infiltration and increased the surface runoff. (Caporali et al., 2023)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Poor or insufficient urban planning (mentioned in 50 papers) -such as building in vulnerable zones, illegal construction, or informal settlements- and changes in land use (mentioned in 24 papers) have also been identified as factors that have increased the urban vulnerability. For instance, in Cesky Krumlov, a historic medieval town in the Czech Republic, ground floors were historically used for service spaces to minimize flood losses, but today they are occupied by shops, hotels, and restaurants, making them more vulnerable to damage. (Nedvědová, 2013)

Canalizations and river modifications, initially intended to reduce flood impacts and regulate water flow, were often poorly studied or underestimated, sometimes leading to the opposite effect. A clear example of how human interventions increased flood risk can be found in Poland. In the 19th century, following severe floods with high casualties, engineers artificially narrowed the Vistula River by 40% and altered its course to protect urban areas. (Cyberski et al., 2006; Porębska et al., 2019; Starkel, 1982) However, these changes reduced the river's natural flood-absorbing capacity and increased flood risk, putting Krakow's historic UNESCO-listed center at greater risk today. According to Grela (2023), the false sense of security created by embankments and river modifications led to dense urban development in formerly flood-prone areas of Krakow. His research shows that today, over 32% of the population—more than 250,000 people—are at risk in the event of dam failures or extreme flood scenarios. (Grela, 2023). In Genova, Italy, the modification of natural streams and their transformation into sewers and hydraulic structures, during the last two centuries has significantly increased flood risk and is now considered the primary cause of flooding in the city. (Lanza, 2003)

In the context of heritage sites, there are cases where protective measures are insufficient or poorly maintained. The absence of flood defense infrastructure leaves sites vulnerable to inundation during extreme weather events. (Cuca and Barazzetti, 2018; Forino et al., 2016; Garrote et al., 2020) Tourism pressure also affects the implementation of protective measures, as historic urban fabric is often repurposed for tourism without consideration for climate-related risks. In many cases, preservation requirements driven by heritage or tourism value can limit the possibility of introducing effective flood-proofing interventions. (Bianco and Montedoro, 2023; Pakdeeburee et al., 2011)

### **Endogenous factors: Inherited Urban Form, Infrastructure, and Material Vulnerabilities**

Endogenous are the factors refer to the internal characteristics of a city, including its socio-spatial structure - such as unequal development, marginalization and social vulnerability (19 papers), outdated infrastructure and drainage system (59 papers), topography (mentioned in 49 papers) and materials used in traditional construction (16 papers). These factors developed over centuries and are not necessarily the result of recent human decisions, but rather reflect the historical and spatial evolution of a city.

The drainage system plays a pivotal role into the flood resilience In many historic cities, drainage infrastructures were designed for earlier urban scales and climatic conditions and cannot withstand today's increased rainfall intensity and urbanization. Approximately 70% of the reviewed papers identify old infrastructure and drainage systems as key flood risk factors

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

in contemporary historic cities. For example, the drainage system at the Roman Agora of Athens in Greece, once pioneering and functional, is now ineffective because it is old, partially non-functional, limited in capacity and overwhelmed by the increased runoff due to climate change. (Iliopoulou et al., 2023) A similar situation is observed in Corfu, Greece, where the historic drainage system dates back to the Venetian era, was not designed to accommodate modern extreme weather events (Dimitriou, 2022; Maistrou et al., 2023).

Historic cities, from Rethymnon in Greece to York in the United Kingdom, or the temples of Bagan in Myanmar, often used locally available materials for construction that are highly susceptible to water damage. These include soft calcareous stones, porous masonry, earth-based materials, limestone, and timber (Chitty and Sprega, 2018; Li, 2024; Ravankhah et al., 2019; Stephenson and D’Ayala, 2014)

The organic growth and morphology of the heritage cities, also affect their vulnerability. **Narrow streets**, a common urban language in heritage sites due to their historical urban benefits, today directly affects how water flows, drains, and accumulates within the city, decreasing the runoff and leave little room for structural adaptations.(Dimitriou, 2022; Maistrou et al., 2023).

In addition to physical characteristics, socio-spatial factors also shape flood risk. Several articles highlight that areas with vulnerable populations—such as the elderly—or the presence of critical infrastructure, like health facilities, increase the level of risk. (Apro et al., 2016; Di Salvo et al., 2018; Foudi et al., 2015; Gandini et al., 2017; Su et al., 2024)

Quito is a strong example of a city where flood vulnerability stems primarily from endogenous factors. Located in a steep Andean valley, the city’s natural topography direct intense rainfall straight into its urban fabric, heightening the risk of flash floods. While some anthropogenic changes—such as the covering of natural ravines during urban expansion—have worsened runoff, the core drivers of Quito’s flood risk lie in its internal characteristics. These include its historical development pattern, dense urban form with narrow streets, and the use of traditional building materials like adobe and timber, that are especially vulnerable to water damage. These features, shaped over centuries, were not designed for extreme rainfalls, due to climate change conditions. The big 2022 flood, led to many casualties and economic losses, revealed how this inherited urban structure and setting contribute to the city’s fragility in the face of increasingly intense weather events. (Trizio et al., 2022; UNESCO World Heritage, 2024)

### **Systemic factors: Governance, Policy Gaps, and Institutional Failures**

Systemic factors include the broader political, economic, and governance-related issues that affect the decision-making in flood management. It is about the lack of sufficient long term management plans against flood risk, the cooperation among the stakeholders or the economic structures and funding projects for infrastructure maintenance.

35 papers highlight how governmental issues, such as politician collusion, law system or regulations are playing a pivotal role into the flood risk management as main factors of flood risk response, while others explain the importance of missing important data (7 papers), or slow or even nonexistent monitor and early-warning systems or emergency plans (21 papers)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

while others explain the importance of national fundings or economic pressures in the risk management plans (34 papers).

Others point to the lack of education; including its capacity to understand, prepare for, and respond to risks like floods as a major systemic factor that affect emergency plans today. (Ginzarly et al., 2024; Munpa et al., 2024; Potdar and Verbakel, 2022)

A widely cited example of systemic failures in flood management is that of New Orleans during Hurricane Katrina in 2005. Despite repeated warnings about the city’s vulnerability, government agencies failed to act in advance. The levee system, which was intended to be completed in 13 years at a projected cost of \$90 million, ultimately took 40 years and cost nearly \$700 million, and yet it remained incomplete at the time of the disaster. When the hurricane struck, poorly designed and maintained levees failed catastrophically, specifically, 170 miles out of 350 miles of protection, were breached or destroyed. Simultaneously, disaster response between the U.S. Army Corps of Engineers (USACE), local levee boards, and state authorities was slow and uncoordinated, leaving many residents—especially in low-income areas—without evacuation assistance. Critically, the USACE relied on outdated storm data (the 1959 Standard Project Hurricane), ignoring more recent forecasts and expert recommendations. (Genova et al., 2020; Heerden et al., 2006)

### **An Example of All Factors**

Although in most cases it is not only one category of factors responsible for the increased flood events in the historic areas, rather the combination of them. Most flood risks are due to multiple overlapping factors, as seen in Ayutthaya, a UNESCO World Heritage Site in Thailand. In that case study, flood risk is due to a combination of natural geography, historical urban design, human-induced changes, and systemic governance failures:

Naturally, the city is located on a low-lying floodplain surrounded by three rivers -the Chao Phraya River, the Lopburi River and the Pa Sak River- making it highly vulnerable to seasonal flooding. The basin area is flat, with an average elevation of 1 to 2 m above mean sea level with certain even lowered down to sea level due to land subsidence. (Natural Factors). Human activities such as rapid urbanization, deforestation, and river modifications have reduced natural water absorption, increasing flood risk in the area. Also, the pressure from tourism has led to more construction and paved areas around the heritage sites, which makes it harder for water to drain and increases the risk of flooding. (Anthropogenic Factors). Historic temples were made of vulnerable materials like laterite, stucco, and wood, so they currently suffer severe water damage during floods. (Endogenous Factors) (Daungthima and Kazunori, 2013; Pakdeeburee et al., 2011; Thanvisitthpon, 2019) The 2011 floods have been devastating for a large number of cultural heritage sites in the area (including museums, temples, archaeological sites, cultural landscapes, and historic landmarks) leading the governance to consider for new flood policies. The governmental policies included flood walls, levees, and an improved drainage system that managed to protect the UNESCO site sufficiently, but ultimately, the measures redirected the floodwaters to surrounding peri-urban areas like Bang Ban, Phak Hai, and Sena, worsening flooding there. (Munpa et al., 2024; Thanvisitthpon, 2019) Finally, a lack of public participation and sufficient coordination between stakeholders, have been continually highlighted in various articles as a critical factor

for flood resilience. (Systemic Factors) (Huyakorn et al., 2012; Pakdeeburee et al., 2011; Thanvisitthpon, 2019)

**Toward Resilience: Strategies for Flood Risk Management in Historic Cities**

Flood risk management in historic cities is particularly challenging, as these areas possess high cultural value and are especially vulnerable to natural disasters. Additionally, the implementation of conventional flood protection solutions is often difficult, as they may compromise the historic character of the sites.

The literature typically addresses these challenges through either targeted strategies or holistic approaches. Targeted strategies focus on mitigating specific and immediate problems, such as the protection of critical infrastructure and heritage monuments. In contrast, holistic approaches aim for integrated management, considering cultural, social, environmental, and economic dimensions.

The choice between these approaches depends on local conditions, the nature of the risks, and the availability of resources. Many studies advocate for a combined application of both strategies to achieve the most effective results.

This paper categorizes flood risk management solutions into five main groups: Structural Measures, Technological Measures, Blue-Green Infrastructure, Planning and Policy Strategies, and Social Awareness, Cooperation, and Coordination.

Table 5 Distribution of Categories in Flood Resilience Solutions

**Structural Measures: Physical Interventions**

Structural measures as proposed solutions for flood risk mitigation include physical infrastructure at the urban level -such as flood barriers, dikes, retention basins, or upgrades to drainage systems- and building-level measures -such as reinforcements, flood doors, and building-specific adaptations.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

24 out of the 70 papers included these types of solutions to address flood risk. At least half of them underlined the importance of reinforcing and upgrading the drainage systems in cities to manage large volumes of water, surface runoff, and reduce water accumulation. While some papers propose improvements to the existing drainage systems (Jia et al., 2023; Maistrou et al., 2023; Sesana et al., 2018), others propose alternative approaches. For example, Lanza (2003) suggested the rehabilitation of Genoa’s old cisterns as temporary stormwater storage tanks. This would transform the cisterns into a new, functional component of the drainage system, effectively integrating historic infrastructure into a modern flood control plan. (Brandolini et al., 2018; Lanza, 2003)

The construction of dams and levees is also sometimes recommended in areas of high flood risk. A successful project is the Bilancino Dam in Florence, built after the devastating 1966 floods to regulate water flows from the Mugello basin, that has significantly contributed to the reduction of flood risks in the area. (Coli et al., 2013) On the other hand, research on the MoSE dam system in Venice—which has protected the city from sea level rise for several years—considers it economically successful in the short to medium term, but its long-term viability is uncertain due to ongoing climate change. (Giupponi et al., 2024; Sesana et al., 2018)

At a building level, structural reinforcements are frequently proposed in the literature. In Algira, Spain, it was recommended to reinforce earthen buildings with compatible materials to improve their resistance to water infiltration. (Trizio et al., 2020) In Tomar, Portugal, cost-effective retrofitting measures like flood skirts and replastering were assessed through cost-benefit analysis. (Davis et al., 2023) Keller et al. (2016) also proposed technical reinforcements using natural, eco-friendly materials -such as insulating plasters or reinforced retaining walls with gabions- to enhance energy efficiency, structural stability, and climate resilience, while preserving heritage (Keller et al., 2017) A more extreme solution was proposed by Kurniawati et al. (2020) in a flood prone city in Indonesia, suggesting the **elevation of heritage buildings and critical infrastructure**. (Kurniawati et al., 2020)

Soft capping is another technique that helps preventing flood damage and reduce erosion by using natural, permeable materials -such as soil and vegetation- on the surfaces of the sites. These materials slow runoff, increase water absorption, and gradually reduce erosion, making them a sustainable alternative to traditional materials. Soft capping trials conducted in case studies in Yorkshire and Oxford, showing promising results. However, in some cases, the decision to remove vegetation from historic walls led to local controversy, as some community members perceived the removal of plant growth as neglect rather than a conservation effort. (Hanssen and Viles, 2014; Richards et al., 2024)

### **Technological Measures: The Role of Digital Tools, Monitoring, and Early-Warning**

That category includes techniques such as GIS (Geographic Information System) tools, flood hazard mapping and risk simulation modeling, remote sensing or satellite images, early warning, and real-time monitoring systems. The evolution of technology and the accuracy and effectiveness of simulations in today’s flood management led 50 out of 70 papers to propose these types of solutions.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Early warning systems and monitoring appeared in at least 25 case studies as possible solutions. Monitoring is used to continuously observe and collect data (such as river levels, rainfall, soil moisture, flow rates), while early warning is responsible for analyzing monitoring data, forecasting possible hazards, and issuing timely alerts to populations and authorities. (Brempong et al., 2023; Coli et al., 2013; Cuca and Agapiou, 2021; Dimitriou, 2022) Wu et al. (2024) developed an early warning system for historic districts, combining building, road, and public evacuation risk models with a 1-hour rainfall intensity index. Using real-time data, it helps protect cultural heritage through targeted warnings and preventive actions. (Wu et al., 2024) Young et al. (2021) developed a color-coded hazard matrix that provides a simple, data-driven early warning tool that links rainfall forecasts to flood risk levels (green to red). It helps authorities and communities in data-scarce cities anticipate pluvial floods and take timely action, enhancing preparedness without relying on physical infrastructure. (Young et al., 2021)

GIS tools were used in one-third of the papers to produce flood hazard and risk maps, explore flood-vulnerable zones, or model future scenarios. For instance, KALOGEROPOULOS et al. (2023) conducted a comprehensive study based on hydrological models using GIS, Digital Elevation Model (DEM), Remote Sensing (RS), Rainfall-Runoff Modelling, and Synthetic Unit Hydrograph (SUH) Development. The goal was to highlight flood-prone areas near the archaeological site of Ancient Olympia, in order to identify vulnerable zones and understand water flow behavior under different rainfall scenarios. (Kalogeropoulos et al., 2023)

AI and machine learning techniques, such as Artificial Neural Networks (ANNs), Machine Learning, Bayesian networks, and Metaheuristics, are newer and continuously evolving approaches proposed in recent papers to deal with missing or complex data, identify patterns, and calibrate the vulnerability of cities to flood events. (Ferreira and Ramírez Eudave, 2022; Grau-Bove et al., 2024)

While technological solutions can offer cost-efficient and rapid means of processing large volumes of data, they still have limitations and risk promoting a purely technical approach that may fail to address the complex, multidimensional challenges of heritage cities in urban environments.

### **Planning and Policy Strategies: Integrating Heritage, Regulation, and Risk Management**

These types of solutions are the most common among the papers, found in at least 54 of them. They include Integrated Management Plan, regulatory framework and tourism impact management.

Integrated Management Plans are at the heart of historic city management strategies. These plans integrate environmental, cultural, social, technological, and institutional parameters, creating a coherent framework that combines flood prevention with the protection and conservation of cultural and historical values. They aim to ensure the sustainability and resilience of historic areas. These plans emphasize a multi-dimensional approach, promoting collaboration between local authorities, communities, and individuals, and they typically incorporate both physical and technological solutions. The literature consistently emphasizes the need to integrate climate adaptation into heritage planning efforts. (Keller et al., 2017; Liu

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

et al., 2019; Sesana et al., 2018) To achieve this, scholars frequently propose specific measures such as incorporating flood risk into urban planning and zoning regulations, and applying systematic inundation scenarios and modeling to support both preservation planning and emergency preparedness. (El-Behaedi and Ghoneim, 2018; Ortiz et al., 2014)

Regulatory frameworks form another important pillar of planning and policy strategies since they provide the legal, administrative, and institutional tools, necessary for the management, protection, and sustainable development of areas affected by flood risks. Many studies underline the value of aligning national and local strategies with international regulations, like European Directives about floods, UNESCO Convention on the Protection of the World Cultural Heritage, and Historic Urban Landscape or the Intergovernmental Panel on Climate Change (IPCC) guidelines as an important solution towards flood vulnerability. (Chen et al., 2024; Chigurupati, 2008; Kutut et al., 2021; Perez-Alvaro, 2016; Sesana et al., 2018)

Tourism is a critical factor that can have both negative and positive effects on flood risk management and the sustainability of historic cities. On the one hand, tourism development often increases vulnerability by altering the social identity of cities and shifting resources away from long-term strategies like flood mitigation toward short-term economic gains. It can also intensify pressures on cultural heritage already at risk from climate-related hazards. (El-Behaedi and Ghoneim, 2018; Ortiz et al., 2014) On the other hand, tourism can also support flood risk management when it is well-regulated. The literature proposes various solutions, such as controlling the number of visitors or rerouting tour buses away from flood-prone areas. Tourism may also aid in post-flood recovery by generating financial revenue and increasing media visibility, which can attract attention and external support. (Bianco and Montedoro, 2023; Maistrou et al., 2023; Sesana et al., 2018) Campaigns like #EnjoyRespectVenezia, launched during the International Year of Sustainable Tourism for Development, are aiming to educate tourists on responsible behavior, indirectly promoting respect for fragile, flood-prone heritage. (Balan and Bordelon, 2021) Another innovative proposal is the implementation of voluntary tourist donation systems, such as in Ayutthaya, which offer a low-cost and scalable way to engage visitors in flood protection and heritage conservation. (Sakonnakon et al., 2012)

### **Blue-Green Infrastructure: Nature-Based and Ecosystem Approaches for Urban Resilience**

This category includes softer urban solutions such as eco-corridors and buffer zones, green spaces and wetlands restoration, permeable surfaces, and adaptive urban planning strategies. While structural measures are essential for immediate flood control, blue-green infrastructure offers a more sustainable, adaptable, and environmentally friendly approach. Despite its importance, only 14% of the papers (10 papers) included this type of solution in their proposals. This limited representation is likely due to a combination of factors: historical preference for structural measures, perceived complexity and cost of implementation, limited immediate impact during flood events, integration challenges, and a lack of interdisciplinary expertise. Flood management has traditionally been led by civil engineering and hydrology disciplines, which often favor quantifiable, technical solutions.

---

Nature-Based Solutions (NBS) were proposed in case studies such as Florence, Corfu, Hoi An City, and Guangzhou. These include rain gardens, urban wetlands, tree planting, and permeable pavements, all designed to regulate rainwater, reduce surface runoff, and improve water infiltration. Such interventions help restoring the natural hydrological cycles within urban environments without disrupting their cultural character. (Caporali et al., 2023; Dimitriou, 2022; Nguyen et al., 2024; Su et al., 2024) Other projects are recognizing the ecosystem service values and highlight the importance of restoring wetlands and coastal areas to act as natural buffers against storm surges and flooding. (Foudi et al., 2015; Genova et al., 2020; Sesana et al., 2018)

In Romania, one proposal involved the transformation of a breached dam lake to a floating park, that could absorb floodwater while also serving recreational purposes. The park would include elevated alleys accessible after rain, wetland-compatible vegetation like reeds and rushes and terraced slopes planted with trees like willows and cypress. (Keller et al., 2017)

### **Social Awareness, Cooperation and Coordination: Engaging Communities and Promoting Shared Responsibility**

At least 33 papers, underlined the importance of community-based approaches, the public engagement and education, the integration of traditional knowledge and the participatory urban planning.

At least 33 papers underline the importance of community-based approaches, public engagement and education, the integration of traditional knowledge, and participatory urban planning.

There is a recurring question in the literature about the inclusion of local communities in planning due to their intimate knowledge of place, lived experiences of past disasters, and capacity to contribute to more context-sensitive, accepted, and sustainable solutions. (Marchetti et al., 2020; Munpa et al., 2024) Specifically, in the examples of Ayutthaya and Corfu, it is highlighted how local knowledge and traditional adaptation practices can preserve the cultural heritage of the areas. (Dimitriou, 2022; Shirvani Dastgerdi and Kheyroddin, 2023)

Inter-collaboration and cooperation are also considered critical in order to produce efficient flood risk plans while preserving the character of the cities; a flood-resilient plan should be a collaborative plan among engineers, architects, heritage specialists, local authorities, and the public. (Kumar, 2020; Kuźmiński, 2016; Nedvědová, 2013; Ortiz et al., 2016)

Education is also highlighted as a fundamental tool for building long-term resilience, not only as a means of raising awareness of flood risks and preparedness but also because it creates a shared sense of responsibility toward the protection of cultural heritage. Several studies emphasize the need for educational programs targeting both residents and decision-makers. (Daungthima and Kazunori, 2013; Maistrou et al., 2023; Pakdeeburee et al., 2011) Banfi et al. used VR glasses simulations for educational purposes to increase awareness by visualizing flood risks and the structural behavior of heritage sites in various environments. (Banfi et al., 2020)

A case study in Reading, UK, demonstrated how integrating local communities alongside technological tools improved flood risk management. The study proposed flood risk maps that

## PROCEEDINGS

---

combined traditional technical models with participatory insights from local residents in order to create more accurate flood risk maps. The locals were able to better identify areas that had previously flooded, drainage system failures, and social vulnerabilities (such as high-risk, low-income neighborhoods) that purely technical solutions could not evaluate or identify. (Bullen and Miles, 2024)

n Ayutthaya, a Role-Play Gaming Simulation (RPGS) is proposed: a participatory simulation tool where citizens, government, the private sector, and experts take on different roles (such as urban planner, resident, tourist, teacher, merchant) to simulate decision-making for flood management, exchange ideas, brainstorm, and understand the complexity of flood risk management. (Huyakorn et al., 2012)

### **Conclusions: Key Lessons and Future Directions for Sustainable and Resilient Heritage Cities**

Flooding represents an increasing threat to modern societies, particularly to historic cities, where the cultural value of the urban fabric is at risk. In recent years, the academic community has shown growing interest in addressing flood risks in urban environments by proposing sustainable and adaptable solutions.

This paper, through a literature review of 70 case studies, aims to explore the factors that make historic cities vulnerable to flood events, categorizing them into four groups: natural, anthropogenic, endogenous, and systemic. While the boundaries between these categories are often blurred -due to overlapping causes or differing interpretations- the goal is to emphasize how cities with diverse historical, cultural, topographic, and urban characteristics face similar challenges when it comes to flooding. Climate change has intensified natural hazards, particularly rainfall and sea-level rise, while the natural topography of many historic cities, often located near water for strategic or economic reasons, further increases their exposure.

At the same time, anthropogenic and systemic issues such as rapid urbanization, poor urban planning, aging or inadequate drainage infrastructure, lack of public awareness, and insufficient policy coordination significantly contribute to present-day flood risks. Many of these vulnerabilities originate from within the urban systems themselves, suggesting that they can be addressed through sustainable development strategies.

However, standard flood protection measures cannot always be directly applied in heritage contexts, due to architectural, cultural, and legal constraints. Each historic city presents unique geographic conditions, architectural heritage, and socio-economic challenges. Therefore, flood management strategies must be carefully adapted to each context to simultaneously preserve cultural identity and enhance resilience.

The analysis of proposed solutions through the literature reveals that, while structural interventions (such as dams, levees, and drainage improvements) are sometimes necessary, they may disrupt the aesthetic and cultural character of heritage cities. Such measures must be designed with sensitivity by interdisciplinary teams including engineers, architects, urban designers, and conservation experts. Furthermore, grey infrastructure alone is no longer sufficient to address today's flood risks. Long-term mitigation strategies must include green infrastructure -such as vegetated areas, restored wetlands, and natural drainage systems- which can enhance flood resilience while respecting the specific constraints of heritage sites.

---

Technological innovations also play a key role in flood prevention, offering tools like GIS mapping, real-time monitoring, and early warning systems. Nevertheless, these must be integrated with local knowledge and cultural heritage considerations to be truly effective.

Community involvement is equally essential. Inclusive, participatory approaches ensure that solutions are not only technically effective but also socially accepted and sustainable over time.

Ultimately, achieving flood resilience in historic cities requires a delicate balance: between modern technologies and traditional knowledge, between hard infrastructure and nature-based solutions, and between international frameworks and local engagement. Only through tailored, context-sensitive strategies can ensure the protection of these invaluable historic cities for future generations.

# THE PROTECTION AND MANAGEMENT OF COASTAL AREAS IN GREECE. EVALUATION OF RECENT LEGAL FRAMEWORK (L. 5092/2024)

DOI: 10.26341/issn.2241-4010-2025-9a-4-K02105

### **Abstract**

The protection and management of the coast and beach as public goods derives directly from article 24 par. 1 of Greek Constitution. The State is obliged to protect the natural environment, part of which is the coasts and beaches, which belong to the public property (article 967 of the Civil Code). Also, the State should take particularly preventive or statutory measures to preserve the vulnerable ecosystem of coastal areas, to protect their natural beauty and, at the same time, to ensure their public character in a beneficial manner.

After two decades of the implementation of the previous legal framework (L. 2971/2001) regarding the protection of coastal areas, the legislator deemed it necessary to reform it completely. The main goal is to achieve a more integrated and effective framework for the protection and management of coastal environment in Greece. Thus, L. 5092/2024 was enacted in March 2024.

The main objects of the new institutional framework is to ensure, on the one hand, the free access for all citizens to the beaches with the greatest possible assurance of their common character in combination with the protection of the natural environment, and, on the other hand, to allow their exploitation by the State to strengthen the national economy with more transparent and accelerated procedures.

The new Law regulates the conditions and restrictions that can be applied to the coasts and beaches included in the network «Natura 2000» protected areas and introduce the term «trackerless beaches». Also, it establishes a transparent digital procedure for the leasing of beaches, flexible digital tools (drones and satellites) for effective controls, stricter rules and penalties for their management.

In the present article, an attempt is made for a first evaluation for the new rules which were established recently, in combination with the policies and practises that have been applied until the recent revision with L. 5092/2024.

**Key words:** coastal areas, public good, management, protection, revision, legal framework, evaluation, policies

### Introduction

The protection and management of the seashore and the beach<sup>57</sup> as public goods, derives directly from article 24 par. 1 of Greek Constitution<sup>58</sup>. According to the interpretation of the article, the State is obliged to protect and safeguard the natural environment, part of which is the seashore and the beach, and furthermore, it has the obligation to take special preventive or repressive measures within the framework of the principle of sustainability for their protection. These measures are necessary to preserve the fragile ecosystem of the coasts and protect their natural beauty. At the same time, the measures ensure their public character<sup>59</sup>, because, as it emerges from the above article of the Constitution, unhindered access and enjoyment by all citizens is a right that should be protected. Also, their protection in every beneficial way serves the public interest.

The main legislation that regulated the issues of the protection of coastal ecosystems and included provisions for the definition of the seashore and the beach and the permitted uses of them, was the Compulsory Law (A.L.) 2344/1940 (Government Gazette FEK A 154). The

---

<sup>57</sup> Papapetropoulos, A. (2009) "SPATIAL PLANNING OF THE COAST AND THE BEACH. THEORETICAL AND LEGAL APPROACHES (June 2009)", LAW AND NATURE, [nomosphysis.org.gr](https://nomosphysis.org.gr) at <https://nomosphysis.org.gr/11749/o-xorotaksikos-sxediasmos-tou-aigialou-kai-tis-paralias-theoritikes-kai-nomologiakes-proseggiseis-iounios-2009/>: Our country with a coastline length of 15,000 kilometers has the largest ratio of coastline length per square kilometer of land in the world, after Norway. The coasts, therefore, as well as the seashore and the beach, constitute an extremely important national resource and an important comparative national advantage at EU level.

<sup>58</sup> Decision of the Council of State (S.T.E.) 2370/2023: "As it is consistently accepted, with the provisions of Article 24 of the Constitution, the natural and cultural environment have been reduced to independently protected goods. Coastal ecosystems are an essential part of the natural environment, and indeed vulnerable, which, according to the settled case-law of the Court, must, within the meaning of the abovementioned constitutional requirement, be subject to a special regime of mild management and development, in accordance with the constitutionally enshrined principle of sustainable development. This status is usually the subject of a special law, in any case, however, the coasts are directly subject to the protection imposed by Article 24 of the Constitution

<sup>59</sup> The coasts and beaches are public (except for transactions) and for public use. Their main purpose, as public use, is "the free and unhindered access of the public to them, as well as the communication of the land with the sea, lake or river". In accordance with the provisions of Article 967 of the Civil Code (CC) and Articles 1 and 5 of the Compulsory Law (Law 2344/1940) and Article 2 of Law 2971/2001, the seashore and the beach are included in the common property, which are intended for the direct service of a public purpose, and their management is an exercise of public power.

---

law was applied for sixty (60) years and regulated with its provisions issues and problems that arose only along the coastline towards the land area, that is, at the point where the sea meets the land. With this institutional framework, there was no comprehensive framework for the overall planning and management of the coastal zones. According to Kokosis, X, Beriatos, H., (2016:7) «The practical result of its application, for over half a century, was the demarcation (topographic demarcation) of the seashore on only 12% of the Greek coastline». The above law was repealed in 2001 by Law L.2971/2001 (Government Gazette FEK A 285). The philosophy of this institutional framework has also failed to address the important issues of coastal zones management as a whole. However, it set a more integrated framework for the seashore and the beach, for the process of delimitation of coastal zones, for the ownership and permitted activities on the seashore and on the beach. Law 2971/2001 was amended in some of its provisions, in part, by various pieces of legislation (Law 4281/2014, 4321/2015, 4607/2019, 4676/2020, 4787/2021). After two decades of implementation of the above law, it was necessary to reform the institutional framework for a more integrated and effective framework for the protection and management of the coastal natural environment. This because the new legal framework had to be adapted and comprehensively solve the problems caused to the seashore and the beach by the great environmental and man-made pressures, the major natural disasters due to climate change and also, it was necessary to rationalize and prudently manage the exploitation of the natural wealth of the seashore and the beaches of the country by the intense tourist activities. At the same time, to contribute economically to the national economy and to adapt to European standards and global data for the management of the coastal areas.

The new institutional framework (L. 5092/2024 Government Gazette FEK A 33), repealed most of the provisions of the previous law (2001). It includes provisions that ensure the free access of citizens to the seashores and the beaches enhance their public character and protect them as sensitive ecosystems. Also, provisions set for their simple use by the State in order to strengthen the national economy with transparent and expedited procedures.

The reforms of the new law concern the redefinition of the concepts of the seashore and the beach, define the terms and restrictions to be applied for seashores and beaches that are included in the "Natura 2000" protection areas and introduce the term «trackerless beaches». It also introduces a transparent digital procedure for the lease and economic exploitation of beaches and stricter rules for their management. Furthermore, the framework of penalties becomes stricter when the law is violated by the offenders. New, flexible digital tools (drones and satellites) are being introduced to make them more efficient.

In this article, an attempt is made to study and record the new provisions of the L.5092/2024 and demonstrate the spirit of the new institutional framework compared to what the previous institutional framework provided. Also, a first assessment is made, in relation to its policies and applications.

### **The public character of the seashore and the beach according to the long-standing legislation in force**

The public character of the seashore and the beach has already been determined by the basic institutional framework of Law 2344/1940 (FEK A 154). It was a post-war law and the first to

## PROCEEDINGS

---

describe that the seashore is a public good, belongs to the State, which manages it.<sup>60</sup> The concept of the public character of the seashore and the beach and its acquisition by the State of the above law was maintained with the force of the Civil Code and the latter includes in its provisions the elements of public use and the public acquisition and management of the seashore and the beach until today.

The provision of Article 966 of the Civil Code<sup>61</sup> stipulates that things outside the transaction are common to all and are intended to serve public needs (public, municipal, community, religious). These needs serve the general interest of the population. As goods (things) outside the transaction, they are not the subject of real relations and their exploitation is subject to restrictions.

The provision of Article 967 of the Civil Code<sup>62</sup> provides that seashores are public things that can be natural or artificial and are available for free access and use by an indefinite number of people. These public spaces are used freely, unhindered, with accessibility. In this way, a public law relationship is created between the citizen and the State and the citizen's relationship with the common use of the seashore and the beach with their public character. Article 968 of the Civil Code<sup>63</sup> public property belongs to the state and only when it is defined by law can they belong to a Municipality, a Community, a private individual. In the above sense, the use of the seashore and the beach may be public for the citizens, but the latter can't be the owners in terms of ownership. This because the seashore and the beach belong to the public property of the State which includes things that serve purely public purposes. Any right in rem of the citizen to them (seashore and beach) will be determined only by a special law. Thus, according to Article 971 of the Civil Code,<sup>64</sup> things outside the transaction, such as the seashore and the beach, lose their public character only when they cease to serve public purposes. Also, as public property, they are not subject to special rules to determine their public character. No special administrative Act is required. Seashores and beaches are included in the public property of the State.

---

<sup>60</sup>Compulsory Law 2344/1940 (FEK A 154): "The seashore, i.e. the land zone surrounding the sea, which is wet from the largest but usual waves rises, is common property, belongs as such to the State and is protected and managed by it".

<sup>61</sup>According to Article 966 of the Civil Code: "Things other than transactions are those common to all, those common and those intended to serve public, municipal, community or religious needs".

<sup>62</sup> According to Article 967 of the Civil Code: "Things of common use are in particular waters with free and perpetual flow, roads, squares, seas, ports and bays, banks of navigable rivers, large lakes and their banks".

<sup>63</sup> According to Article 968 of the Civil Code: "Public utilities, if they do not belong to a municipality or a community, or the law does not stipulate otherwise, belong to the State".

<sup>64</sup> According to Article 971 of the Civil Code: "Things outside the transaction shall cease to have this status from the moment they cease to be intended for common use or for public, municipal, community or religious purposes".

---

In the urban planning legislation of Law 1337/1983 (Government Gazzete FEK A 33), which is the first integrated legal framework for the urban planning organization for the cities, there is a special reference to its provisions for the seashore and the beach.

Thus, Article 23 of the law refers to a variety of regulations that protect the coasts and consequently the seashore and the beach from building within them and from their land development and use by the owners who own real estate near the coast. The construction of buildings within the seashore and the beach is not allowed and if such buildings are constructed are demolished. Also, in areas that there is no approved urban plan or in cities or settlements that have been anointed before the year of 1923 and within a zone 500 meters wide from the shores of the sea (or from the shores of public lakes), fencing is not allowed and demolished as arbitrary. Only in exceptional cases can fencing be allowed and if a presidential decree is issued with terms and conditions. Furthermore, the right granted by the basic Compulsory Law (L. 2344/1940) to the owners to erect villas for private use and to construct kiosks, or to install tents on the seashore, was prohibited. It was also defined that the beach zone starts from the fixed boundary of the seashore to the land. In cases where the seashore cannot, due to the nature of the continuous land, serve the rules of urban planning of an area to be built, it can be widened and built from the adjacent land after a width of 50 meters and not 20 meters as was the case in basic Law 2344/1940.

The construction on the seashore and on the beach and the cancellation of their communal character was the subject of appeals by the owners of properties they owned near or next to or on the coast. These issues were decided by the Supreme Court of the Council of State (STE), which with numbers of decisions examined the cases in accordance with the provisions of Article 24 of the Constitution for the protection of the natural environment, and, consequently, the coast, the seashore and the beach. The Supreme Court (STE) applied the principle of proportionality and the condition of compliance with urban planning legislation on the way that a real estate can be built in coastal areas, in conjunction with Article 17 of the Constitution, which protects the right to property. In any case, it was decided that the State should take care of the organization and the operation, recording, management, supervision and control of the coasts and that there should be an integrated planning system for the coastal area of the country.

### **The institutional framework for the seashore and the beach from Law 2971/2001 to Law 5092/2024**

As mentioned, Law 2971/2001 repealed the Law 2344/1990, systematically and comprehensively regulated the framework for the seashore and the beach. The concept of the seashore and the beach, the procedure by which the coastal zones are demarcated, the ownership and the permitted uses of the seashore, i.e., the process of granting the simple use for the exercise of activities within the seashore to serve the widest number of persons (tourist activities, public recreation) has been redefined.

Article 1 state that the seashore is the zone of land that is washed by the sea during the longest and usual waves of its waves. Also, the seashore is an essential element of the natural environment, which is protected by the State, which manages it, according to its nature and its communal character. It's meaning and content is the same as the basic Law 2944/1940.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

In Article 2, the beach is the land zone that is added to the seashore to serve the communication of the land with the sea and vice versa, as well as for the preservation and protection of the coasts from erosion and the protection of the seashore in general. A newer addition was made with an amendment by article 23 par. 2 of Law 4607/2019 (Government Gazette FEK A 65), which determined the minimum and maximum width of the beach from the shoreline, which cannot be less than 30 meters and more than 50 meters from the line. There was also an exception by which the Determination Committee (provided for in article 3 of the law) could, after examining every parameter and with a reasoned judgment, determine a smaller width for the beach. Also, it is reiterated in the amendment that these are common things (goods) that belong to the State, according to the principles of sustainability and spatial planning. For the first time, this provision should draw up a list of the prices of the concession of the simple use of the seashore for economic activities in order to have a uniform policy on concessions throughout the country. Their shared use ensures the unhindered access of an indefinite number of people to the seashore and the beach. Also, the construction of buildings and structures on the seashore is prohibited. Exceptionally, only the execution of projects and the facilitation of access for persons with disabilities are allowed. Arbitrary buildings are demolished (article 27 of the law) and a demolition protocol and an administrative fine are issued by the Land Service. Also, in addition to the demolition protocol and the imposed administrative fine in case of violation of the provisions of the law on illegal construction, prison sentences of at least one year are also provided.

The seashore and the beach are mapped in accordance with the provisions of articles 3 and 4 of the law, through administrative procedures through the Mapping Committee. This is the Committee, which is constituted by decision of the Minister of Finance and consists of members of the public administration (head of the Land Service, engineer of the Land Service, the competent Port Authority, the director of the Urban Planning Directorate, etc.). The elements that the Commission takes into account in determining the boundary line of the seashore are, in addition to the orthophotomaps (technical maps), the geomorphology of the soil, the natural boundary of the vegetation, the boundaries and type of coastal natural resources, the findings from the assessment of the meteorological data of the area, the morphology of the seabed, the sector of wave development in relation to the coastal front, the existence of technical works in the area, which legally exist, any approved spatial planning directions and land uses affecting the coastal zone, the existence of public lands of any category that are in the immediate vicinity of the coastal zone, any existing Land Registry and the existence of vulnerable ecosystems and protected areas. The inspection also requires an autopsy in the determination area. The drawing is done ex officio either by the Determination Committee, or after an application submitted by each interested party.

Also particularly important are the regulations for the definition of the old seashore in a coastal area, when it results from movement coastline to the sea and which is due to natural silts or legal technical works. It is determined by the new shoreline and the boundary of the previously existing shoreline (Article 6 of the Law). The Commission determines the old location of the seashore that existed until the year 1884, if there are occupations by private individuals, but also before, if there are no such occupations, provided that the location of the old seashore results from indications on the ground or other evidence, with the exception of witness testimony. It also seeks and takes into account all the elements required for the exact

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

delimitation of the old seashore which it cites in its report, in particular natural indications (such as sandy, marshy or swampy areas contiguous of the seashore), aerial photographs, maps and geological studies of various years.

The Commission also defines the beach zone and draws the boundary line in yellow, either on its own initiative or at the request of the interested party (Article 6). The rights in rem of private individuals over the properties of the beach are expropriated due to public benefit on the condition of compensation. Legal entities under public law (N.P.D.D.) grant to the State their rights in rem over real estate located on the beach without compensation. An exception exists for hotels, organized tourist camps (camping) and complex tourist accommodations which can apply for the expropriation of the part of the beach zone, located in front of and along the property of the hotel accommodation and pay the entire compensation provided for by them, without the obligation of the relevant Municipality or the State to compensate the owner. In addition, under Article 10, where individuals assert ownership rights over land designated by the Commission as belonging to the seashore, those rights are to be regarded as necessarily expropriated in favour of the State in order to be included in the seashore. Compensation is determined in accordance with the legislation applicable to forced expropriations.

Its redefinition of the seashore, the beach and the old seashore, can be done when the boundary line has been incorrectly defined, or when the boundary line has been changed due to natural or technical works. The procedure is carried out either ex officio or upon request of each interested party to the competent Land Service. All documents proving the error of the initial demarcation of the boundary line (Article 7) are required.

Article 13, as amended by subsequent provisions of law and before 2024, regulates the issues of the simple concession of the seashore and the beach. Simple use is that by which they are not intended as common things and there is no alteration in their physical morphology and their biotic elements. The concession is made for a fee; the concession of the simple use is made for the purposes of leisure of the public on the beach and for related activities. The law mentions the placement and rental of umbrellas, marine recreation, umbrella seats and a canteen. The area of each concession may not exceed five hundred (500) square meters and must remain a free area of the seashore at least fifty percent (50%) of its total area, depending on the quality characteristics of the seashore. The space does not include spaces that are inaccessible and cannot be used. In neighboring businesses, businesses located towards the seashore and the beach can be made a simple concession without an auction, for a period of up to three (3) years. The limitation of the area of each concession for the simple use of the seashore, beach, of five hundred (500) meters does not apply to concessions adjacent to the public area of hotels, organized tourist camps (camping) and complex tourist accommodations that operate legally. Each business should leave a free zone of at least two (2) meters from the boundaries of the other. If the façade of the business is less than six (6) meters, the free zone is reduced by fifty percent (50%) at its limits.

In addition, special cases of simple concession of use for financial consideration are provided and the Placement in the sea, without intervention on the coast, of floating platforms with a surface area of up to one hundred and fifty (150) square meters for seasonal use up to nine (9) months each year, for cultural purposes and for recreational purposes. It is forbidden to use the platforms for the installation and operation of restaurants or leisure centers.

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

Concessions, except in the cases of neighboring businesses, are made through an auction which can also be electronic. These can be done by decision of the Minister of Finance and a reasoned opinion of the Municipality. Furthermore, a direct concession of use can be made by a joint ministerial decision of the Minister of Finance and Foreign Affairs, when a concession is made to Municipalities. And the Municipalities can grant the use of the seashore and the beach by auction and financial consideration.

The coasts and beaches that belong to the European Ecological Network "Natura 2000" are not completely excluded from the concession process. A special protection regime is provided and the concession of their simple use is allowed, provided that only 30% of the concessional space can be covered with umbrella seats.

### **The new regulations of Law 5092/2024 "Terms of Use of Public Property in Coastal Areas and Other Provisions" – Similarities and Differences with the Previous Legal Framework**

The new provisions of the law were enacted in order to modernize the institutional framework for the management of the country's coastal areas, based on the public interest and the most advantageous use of the coasts. The new law is more coherent and simplified than the previous law. It includes innovative regulations in terms of transparency and the acceleration of the procedures for the concession of the simple use of the seashore and the beach for the enhancement of the economy, new digital technologies for the delimitation and control of violations, prohibits the concession for economic exploitation of beaches belonging to the European Network "NATURA 2000" and introduces the term "untouched beaches", stipulates that these should be recorded in a national list and urbanizes the fines for violators of the legislation. At the same time, it maintains and restores older provisions regarding the private possession of the old seashore.

The concepts of seashore, beach and old seashore still remain the same with some variations. According to Article 2, the seashore is defined as the zone land "washed by the sea during the longest and usual waves. The seashore is an essential element of the natural environment, protected by the State, which manages it, according to its nature and its communal character.". The beach has the same meaning and purpose as the previous law. Thus, a beach is defined: "The land zone, continuous towards the coast, which is defined for the purpose of preserving and protecting the coasts from erosion and to serve the communication of the land with the sea and vice versa, which may not extend more than fifty (50) meters from the boundary line of the seashore". The only difference is that the provision for the minimum width of 30 meters is abolished. The old seashore is: "The land zone, which results from the displacement of the coastline towards the sea, is due to natural causes (natural silts) or legal technical works and is determined by the new coastline and the boundary of the previously existing coastline». The definition remains the same as the pre-existing institutional framework.

In Article 4, a new classification is introduced in the protection of coasts and beaches located in areas within the European network "NATURA 2000". Innovation is also introduced for the first time in the concept of the "untouched beach". These are coasts and beaches of high protection which are of special aesthetic, geomorphological or ecological value. On

---

trackerless beaches, the concession of simple use is prohibited, as well as any other action that may endanger their morphology and their integrity in terms of their ecological functions. 238 untouched beaches have already been recorded and included in the lists. In contrast to the previous regime of Law 2971/2001 which allowed the concession of their use provided that the objectives of conservation and protection of these beaches are not affected, in these areas (untouched beaches) which were included in the European network "NATURA 2000", the concession of simple use is absolutely prohibited, in contrast to the previous regime of Law 2971/2001.

As far as their ownership status is concerned (article 6), the seashore and the beach remain in the ownership of the State and are public property. They are protected and managed by the Land Service. Especially the coasts and beaches that have been characterized as tourist public estates in accordance with the provisions of the current legislation are managed by the Public Real Estate Company S.A. (E.A.D. S.A.).

The differentiation focuses on the ownership status of the old seashore, which reverts to the previous regime of Law 2971/2001, according to which, the old seashore belongs to the private property of the State. That is, the provision that the old seashore belongs to the property of the state is abolished, i.e., the provision that amended in 2019 (article 24 of Law 4607/2019) the private acquisition of the state by law and which was in force in recent years and reverts to the previous legal status. Thus, with this restoration and in accordance with what is in force in the Civil Code and Article 966, the old seashore is not considered a "thing outside the transaction". Therefore, it can be economically exploited and become the subject of private transactions. Its management is under the control of the Public Private Property Development Fund S.A. (T.A.I.P.E.D.) and the Public Real Estate Company S.A. Therefore, in this sense, their public character is negated and contradicts the requirements of the Constitution of Article 24 for their protection and management by the State and the assurance of their public character, accessible to all citizens. However, if a private property is inserted between the seashore and a public road, the owner is obliged to provide free entry to anyone who requests access to the seashore and the beach. An exception to the transfer of the old seashore to the private property of the State exists only in those cases in which the areas of the old seashore bordering on untouched beaches belong to public property and are public property, ineligible for private rights (Article 5).

The procedure for determining the boundaries of the seashore, the beach and the old seashore is deleted in the provisions of Article 5 (par. 1 to 9), applying the same procedure in cases of redefinition of these sections due to an error or if the boundary line is changed due to lawful technical works or natural causes. The new law, maintains the criteria taken into account for the delimitation of the seashore and the beach and adopts the same indicative enumeration as the previous law (soil geomorphology, vegetation, waves, bottom morphology, etc.). However, a regulation is introduced that the alignment of the beach line cannot exceed the building line in traditional settlements, in settlements before 1923 and in settlements with a population of less than 2,000 inhabitants where there is no approved street plan. It is also provided that where there is a city plan; the boundary line cannot exceed the approved street line. For the definition and redefinition of the old seashore, the law preserves the evidence and scientific indications such as the indications on the ground or the natural indications (sandy, marshy or marshy character of the contiguous areas of the seashore), geological studies,

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

diagrams, aerial photographs, autopsy. The time limit of the year 1884 for the characterization and marking of the old seashore is deleted. Instead of this year, it is planned to issue a presidential decree that will determine the entire process of defining the old seashore.

The procedure and restrictions on the concession of the simple use of the seashore and the beach are provided for in Articles 8 to 14. The competent bodies for the concession are the Real Estate Service and the Public Real Estate Company S.A. The difference is that there is no longer provision for the concession by the State to Municipalities, in order for them to proceed with a concession, as was the case with the previous legal regime of Law 2971/2001. The provisions of the concession of simple use refer to the recreation of the public and the service of citizens for leisure activities on the seashore and on the beach, however, there is no indicative enumeration as in the previous Law 2971/2001. The auctions are electronic and are held by the Land Service until March 31 of each year after bidding through the electronic "Register of Concession Contracts for the Simple Use of the Seashore and the Beach". This simplifies the process; there is speed and greater transparency in all procedures.

According to Article 8, concessionaires have an obligation to ensure safe and free passage for all and to install special platforms for access for persons with disabilities. In order to ensure the vertical and parallel passage of the public to the sea and to keep the 4-meter zone free, the umbrella seats can be developed by businesses up to 60% of the area of the concession area or 30% if it is protected seashore. They will also have to post a sign in a prominent place so that the public has access to all the details of the concession, in accordance with the MyCoast digital complaints system, in which citizens can file a complaint for violation of the terms of the concession and the legislation. Also, they should ensure the existence of a lifeguard in case the Municipality has not placed. The costs incurred by the concessionaires for the installation of the special platforms and the lifeguard's remuneration are offset against the concession fee.

Article 9 provides the limitations and conditions for the concession of simple use. Thus, the maximum area of each concession is 500 sq.m. and cannot occupy more than 50% of the area or the length of the front of the discrete section. Between the sections of the seashore and the beach that are allowed to be granted, there is a distance of 6 m., regardless of the time or the procedure. The total number of coastal and beach sections granted in accordance with par. 1 and in accordance with Article 11 it shall not cover more than fifty percent (50%) of the area or length of the front of the distinct section. Seashore and beach are not granted for simple use after a bidding auction when its length or width is less than four (4) meters or when the total area of the seashore is less than one hundred and fifty (150) square meters. The restrictions also apply to concessions of simple use to neighboring businesses or associations. In the event that there are consecutive neighboring businesses, the free zone of 6 m width between their boundaries is observed. The area of the concession space may be reduced by half, so that at least 50% of the area or length of the front of the discrete section is left free. Also, when the business is less than 6 meters long, then the width of the free zone is reduced to 50%.

Article 15 provides the technological tool that monitors the compliance of concessionaires with the terms of the contract. It is about the information system "Register of Concession Contracts for the Simple Use of the Seashore and Beach" which identifies the illegal and arbitrary occupations of the seashores and beaches in relation to the sections that

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

have been granted for simple use, in order for public bodies to be informed, either after a complaint by citizens, or automatically. The system keeps the data (descriptive and geospatial) regarding auctions, concessions for the simple use of coastal and beach sections, complaints and autopsies, as well as geospatially determined photographic material that is used to carry out controls.

Public complaints are provided for in Article 16 and shall be made by electronic means in particular by using a "QR code" on software that is freely available and can be installed on computers, tablets, mobile phones and other corresponding devices of the interested parties. The software is interconnected with the electronic platform "Register of Concession Contracts for the Simple Use of the Seashore and the Beach" and concerns the diagram of the part of the seashore and the beach that is granted. The "QR code" corresponding to each concession for simple use is posted on the website of the Ministry of National Economy and Finance and on the website of the Municipality. It is also mandatory to be depicted on the seashore or beach signage and on the website of the Ministry of National Economy and Finance.

Checks for violations are carried out by the Land Service, the Municipalities, which quickly transmit their findings and reports to the Land Service, the tax authorities, the Financial Police and the Ministry of National Economy and Finance. The Greek police authorities and the public prosecutor's offices are responsible for criminal offences (Article 17).

Administrative penalties are particularly severe (Article 19) and administrative fines are determined by a mathematical formula and depending on the type of violation. The fine for obstructing the free access of the public to the sea, the seashore and the beach, range from a fine from two thousand (2,000) euros to sixty thousand (60,000) euros. The fine for obstructing the audit work of any body, a fine of ten thousand (10,000) euros. Failure to post the sign for the type of concession results in the imposition of a fine of one thousand (1,000) euros on violators. The software provides the ability to immediately send a complaint by anyone who notices an arbitrary occupation of the seashore and beach or an exceedance of the concession. Criminal sanctions (Article 20) carry a one-year prison sentence and a fine to anyone who makes any change on the seashore or beach without or in excess of it or with a permit issued illegally, regardless of damage or damage. Furthermore, if the change causes significant ecological, environmental or geomorphological disturbance or damage, it is punishable by a prison sentence of at least two (2) years and a fine.

## Conclusions

As can be seen from the review of the older legislation and the current legislation for the protection of coastal areas, it seems that the new institutional framework modernizes the system of management of coastal areas.

The new law is comprehensive in its provisions and places particular emphasis on the simplification of the procedures for the simple concession of the use of seashores and beaches, through the electronic auction process, which enhances transparency and speed.

The digitalization of the control tools for any arbitrary violation and illegal occupation of the seashores and beaches and its interconnection with the central public administration, simplifies all the lengthy procedures required for the imposition of administrative and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

criminal sanctions and for the collection of revenues from concessions. In this sense, the objective of the law to strengthen the economy in a beneficial way for everyone involved in the concession of the use of the seashore and the beach appears to be fulfilled. Severe fines and sanctions act as a preventive and repressive measure.

As far as the protection of coasts and beaches is concerned, their protection as sensitive ecosystems is strengthened with the institution of trackerless beaches, however, the framework is incomplete and needs improvements. The fact that the old seashore has returned to the private property of the state, this negates the constitutional requirement of Article 24 of the Constitution by which the seashores belong to its public property and therefore cannot be the subject of a private transaction and also negates their public character. Consequently, the unhindered access to the seashore and the beach by an indefinite number of people.

Also, the technological tools for carrying out automated and remote controls, through satellite images, drones and cameras, as well as the use of the "Register of Concession Contracts for the Simple Use of the Seashore and the Beach", contribute decisively to the limitation of the phenomenon of arbitrariness of the seashore and to the protection of the environment. More integrated management is needed, taking into account an integrated spatial marine planning and management for the protection of coastal areas with emphasis on the ecosystem of beaches and coasts, their rapid delimitation and protection, in terms of resilience and in accordance with the natural and unexpected disasters brought about by the climate crisis.

# THE AXIOS DELTAIC TERRITORY: ESTABLISHING RESILIENCE IN A GRADIENT OF WETNESS

**Kasselouri Elena**

*PhD Student Università IUAV di Venezia*

[ekasselouri@iuav.it](mailto:ekasselouri@iuav.it)

## Abstract

Coastal wetlands are invaluable ecosystems that provide critical environmental, economic, and social benefits. These habitats, play essential roles in maintaining biodiversity, mitigating climate change, and safeguarding coastal communities. However, they face growing threats not only from the overexploitation due to human activities, but also from the intensification of the various climate change effects. Especially in the Mediterranean basin, which is a climate change and biodiversity hotspot, the lowlands gradually gain importance in future adaptation and mitigation processes. This paper explores the role of the deltaic zone of Axios River in Northern Greece, in climate resilience, while acknowledging the nature of this coastal landscape, as a territory in-between water and land, in a gradient of wetness. The scope of this contribution is to investigate the dual meaning of protection in coastal wetlands: environments which need to be protected and which, at the same time, protect the local communities. How can this role of the wetland as buffer against Sea Level Rise and its effects, and as a natural defense against extreme weather events become part of the future resilient deltaic character?

The intended benefits for the reader include an enhanced understanding of the multidimensional value of coastal wetlands and their critical role in climate change adaptation and mitigation. The paper provides a framework for integrating innovative approaches of wetland conservation into broader climate adaptation plans for Mediterranean coastal territories. The methodological tools involve a comprehensive review of the relevant existing literature accompanied by interpretative mapping and design exercises through scenario development for the Axios Delta complex. Key findings of this study include a new perspective for the role of coastal wetlands in the face of climate change, by identifying their territorial particularities and potentialities. The exercises aim to find new systems to ensure the long-term viability of these ecosystems and the protection of Mediterranean coastal communities that inhabit coastal territories in a gradient of wetness.

**Key words:** coastal wetlands, wetness gradient, deltaic territory, Axios River Delta, protection

### **Abstract**

Most lately, several European and Greek cities face high water scarcity challenges, mostly due to climate change, inefficient resource management and population growth. Issues like those are mixed by aging infrastructure and high urban water demand. To address the phenomena of water scarcity, it is required to transform today's approaches that leverage technology to optimize resource use and ensure sustainable water availability for urban use.

This paper studies and presents the role of smart technologies in advancing sustainable urban water management, specifically in Greek cities, mainly focusing on specific initiatives that integrate Internet of Things (IoT) solutions, advanced metering infrastructure (AMI), and real-time telemetry systems. This study is based on recently EEA Grants funded projects, that played pivotal in this transformation, including the deployment of smart household water meters and city-wide telemetry systems for real-time monitoring and control of water networks. Those projects showed significant work in detecting and reducing water losses, optimizing distribution systems, and promoting efficient household water use. This work, highlights the effectiveness of these technologies towards water scarcity combat and building resilience in urban water systems. In addition to the IoT analysis, this work includes also the socio-economic and environmental impacts of these projects, emphasizing the importance of funding mechanisms, policy frameworks, and stakeholder engagement in their success.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Summing up, some recommendations are also provided for scaling these solutions to other urban settings, ensuring wider adoption and impact.

The outcome of this study demonstrates the leverage of smart technologies, coupled with lessons from funded projects, providing a sustainable pathway to address water scarcity in Greek cities. This study contributes to the discourse on urban water resilience, offering actionable insights for policymakers, city planners, and water utilities seeking to create water-secure urban environments.

**Key words:** water scarcity, smart water management, IoT, telemetry systems, smart household meters, Greek cities, climate resilience

### Introduction

Lately, water scarcity is addressed as one of the most pressing challenges for urban areas globally, and more specifically at Greece, as a Mediterranean country. With over two-thirds of its territory classified as semi-arid, and with uneven seasonal precipitation, Greek cities are increasingly experiencing the effects of water scarcity problems, both physical and economic (Baltas et al. 2005, Monokrousou et al, 2024). Intensified extreme weather events, prolonging droughts, and altering hydrological cycles, show that climate change has further exacerbated these challenges (Nastos P.T. et al, 2014, Ferdowsi A. et al. 2024). Simultaneously, urbanization and rapid population growth, particularly in coastal regions and tourist hotspots, place unsustainable pressure on outdated water infrastructure (Kofinas et al. 2016).

Greece has some of the oldest urban water networks, which were developed decades ago, and can be characterized by high levels of leakage, fragmentation, and limited automation. According to recent assessments, non-revenue water (NRW) in several Greek municipalities surpasses 50%, resulting in significant economic, environmental, and operational losses (Serafeim 2022; Nastos P.T. et al, 2013; Chasiotis et al. 2023b). In addition to the above, the even high cost of energy for pumping and treatment, coupled with limited financial and technical capacity in small municipalities, severely constrains the ability of local authorities to manage water resources efficiently (Avlonitis et al. 2007, Nastos P.T. et al, 2009).

Following this context, smart water management technologies offer a transformative potential. Leveraging real-time data collection, predictive analytics, and automated control systems, smart solutions enable utilities to detect leaks, monitor quality, and optimize system performance with greater precision and speed (Sophocleous, S et al. 2019; S.H.A. Koop et al. 2019). Technologies working with Internet of Things (IoT), advanced metering infrastructure (AMI), decision support systems (DSS), and digital twins (DT) are already being implemented, tested or deployed in several Greek municipalities through European and bilateral cooperation projects, such as the EEA-funded projects.

Emerging approaches also incorporate nature-based solutions and hybrid infrastructures – combining digital platforms with environmentally sensitive urban design. These integrated strategies are particularly important in the Mediterranean, where seasonal variability requires adaptive design and resilient urban systems.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

However, while the technical capabilities of these systems are proven, their successful implementation depends on multiple factors including institutional readiness, stakeholder engagement, funding accessibility, and regulatory support (Antzoulatos et al. 2018). In some cases, socio-technical barriers such as lack of public trust or data transparency hinder adoption. Additionally, the absence of long-term performance monitoring frameworks prevents municipalities from scaling pilot successes into broader urban policy.

This study contributes to this discussion by examining three projects as municipal case studies —Paramythia, Aigio, and Argos—where smart technologies have been deployed to address water loss and improve system efficiency. The analysis focuses on technological architectures, implementation challenges, achieved results, and lessons learned that can inform future replication across Greece and similar Mediterranean contexts.

### **1. Water Scarcity Challenges in Greek Urban Areas**

Greek urban cities are facing a growing intensity of water scarcity challenges. These challenges are driven mostly by aging infrastructure, but also by elevated levels of non-revenue water (NRW), the impacts of climate change, seasonal demand surges due to tourism, and in many cities, weak monitoring and management systems. The combination of these challenges poses a serious risk to the sustainability of water resources in cities across Greece—from major metropolitan areas like Athens to mid-sized and smaller municipalities such as Aigio, Argos, and Paramythia. (Nastos P.T. et al, 2014)

#### ***1.A. High Levels of Non-Revenue Water (NRW)***

Non-revenue water (NRW) — which is the amount of water being lost before reaching end-users — is the most common, significant and persistent issue in Greek urban water systems. Studies show that in cities like Kozani, NRW exceeds 50%, creating enormous inefficiencies in both resource use and municipal finances (Kanakoudis 2014). In Drama, similar issues were found, where aging infrastructure, inadequate pressure control, and lack of modern network management contributed to significant water loss (Kazana et al. 2021). These findings are consistent across smaller municipalities, where operational budgets are limited, and investments in smart water systems remain insufficient.

In Paramythia, located in the mountainous region of Epirus, water losses previously reached up to 72%. The high NRW was linked to both outdated pipeline infrastructure and lack of systematic monitoring. However, under the SMASH project, the municipality implemented a digital twin model of the water network, combined with local monitoring stations and virtual sensors, to identify hidden leakages and optimize system performance (Chasiotis et al. 2023a). This demonstrates how digital technologies can mitigate deep-rooted inefficiencies when appropriately deployed.

#### ***1.B. Aging Infrastructure and Network Condition***

A considerable portion of Greece’s urban water distribution infrastructure dates back to the 1960s and 1970s. In cities like Athens, the average pipeline age exceeds 60 years, resulting in

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

frequent failures, such as pipe bursts and valve corrosion (EYDAP 2023). Network rehabilitation has been slow, especially in smaller municipalities, due to a lack of technical capacity and limited access to EU or national funds. In Aigio, a city in Western Greece, a smart leak detection system was implemented to improve infrastructure efficiency. The deployment of digital meters, hydraulic simulation models, and network visualization platforms reduced undetected losses, particularly during seasonal pressure spikes.

Similarly, in Argos, where NRW was previously estimated at 54%, municipal authorities installed a combination of leak detection sensors, hydraulic modeling systems, and local telemetry units. These allowed operators to remotely monitor flow and pressure conditions, identify anomalies, and reduce water losses across the network. This was part of an effort to rationalize network operations while coping with increasing demand and climate-induced variability (Karavitis et al. 2024).

### ***1.C. Climate Change Impacts on Urban Water Supply***

Climatic variability and long-term warming trends are increasingly undermining the reliability of water supply in Greece. The Aliakmon River Basin—one of the country’s key water sources—has been modeled to experience significant reduction in runoff and groundwater recharge due to climate change (Varanou et al. 2005). Warmer summers and more frequent heatwaves not only decrease water availability but also raise consumption levels, especially for cooling and irrigation in urban settings.

This dual stress—decreasing supply and increasing demand—is especially problematic in peri-urban zones where infrastructure is fragmented and systems are poorly monitored. In Argos, for instance, the over-extraction of groundwater during dry summers led to salinization of aquifers. Seasonal declines in reservoir storage meant that during certain months, tap water quality deteriorated significantly, requiring temporary reliance on bottled water or emergency treatment units (Karavitis et al. 2024).

### ***1.D. Tourism-Driven Demand Peaks***

Tourism remains one of the most prominent socio-economic drivers of seasonal water stress in Greece. On islands like Santorini and Mykonos, annual water consumption has doubled in the past decade, as hotels, resorts, and restaurants cater to large influxes of international visitors (Karavitis et al. 2024). However, the phenomenon is not restricted to islands alone. Cities such as Aigio and Paramythia also see summer demand surges, due to domestic tourism and temporary population increases.

In Aigio city, increase leakage risks are stressed by high summer consumption, which creates pressure differentials that also exacerbate energy use for pumping and treatment. The installation of smart meters and seasonal demand forecasting tools helped moderating these peaks, enabling more responsive supply-side management (Chasiotis et al. 2023b). The same is followed by Municipality of Souli in Paramythia, where the integration of real-time data into the DSS platform helped anticipating pressure drops and adjusting system operations preemptively to avoid service disruptions (Chasiotis et al. 2023a).

## 2. Importance of Smart Water Management Solutions

Aging infrastructure, population growth, climate change, and economic constraints put increasing pressure at urban water systems worldwide. In this context, smart water management solutions have emerged as essential tools for enhancing the resilience, efficiency, and sustainability of water utilities. The installation of technologies like Internet of Things (IoT) devices, Advanced Metering Infrastructure (AMI), Supervisory Control and Data Acquisition (SCADA) systems, and digital twins (DT) enables real-time monitoring, predictive maintenance, and data-driven decision-making.

Smart systems, like the ones described above, significantly reduce non-revenue water (NRW), supports leak detection, and improve service quality. Decision support systems (DSS) based on online data and hydraulic modelling allow Municipalities to prioritize interventions, reduce energy costs, and minimize water leakages (Patelis et al. 2020). These technologies are more valuable in cities with aging infrastructure and limited operational budgets, as they offer targeted and cost-effective solutions to systemic inefficiencies.

The importance of AMI and IoT in household water management is also demonstrated in studies which highlight how high-resolution water usage data from smart meters can facilitate user engagement, early leak detection, and adaptive pricing strategies (Cominola et al. 2015). Approaches like those help foster water conservation and allow for more equitable and transparent billing systems.

In the Mediterranean countries, smart water networks have proven crucial for adapting to climate variability, as it is lately the most common solution. In semi-arid urban areas the integration of SCADA systems and smart leak detection platforms has improved both operational efficiency and water quality (Mertzanides et al. 2010). The Paramythia (Municipality of Souli) pilot case under the SMASH (EEA-Grants) project further illustrates how a digital twin, combined with virtual sensors and a DSS platform, reduced NRW and enhanced service delivery in a region historically affected by water scarcity (Chasiotis et al. 2023a).

Smart water management offers a framework that enables proactive, data-driven control of urban water infrastructure. Key features include:

- **Real-Time Monitoring:** IoT devices and smart sensors provide continuous data on water flow, pressure, and quality parameters. This facilitates instant detection of abnormalities such as leaks or contamination (Savić et al. 2018).
- **Automated Metering and Feedback:** AMI allows for remote meter reading, behavioral nudging, and personalized feedback to users. Studies show how household-level data drives water conservation (Makropoulos et al. 2014).
- **Digital Twins and Simulation Models:** These create virtual replicas of water networks, enabling predictive analytics and scenario testing (Manuel Franco-Torres et al. 2021).
- **Decision Support Systems (DSS):** DSS platforms synthesize data from multiple sources and help operators make informed decisions for operational control, maintenance prioritization, and emergency response.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Case studies from across Europe, including SMART-WATER (Antzoulatos G. 2019) in Greece and SWAMP in Italy, demonstrate that such systems can reduce non-revenue water by up to 30%, lower energy use by 15–20%, and significantly extend the lifespan of urban infrastructure (Lewandowski et al. 2019; Antzoulatos et al. 2018).

Figure 1: Estimated Benefits of Smart Water Technologies

Smart systems also contribute to environmental sustainability by reducing unnecessary abstraction from stressed water sources. Dynamic pressure management and demand forecasting can align supply with actual consumption, minimizing both water loss and energy use (Dandy et al. 2022).

Given the high levels of water losses reported in many Greek cities—exceeding 50% in places like Aigio and Argos—the adoption of smart water technologies is no longer optional but necessary. When supported by appropriate institutional frameworks and funding mechanisms, these tools can help Greek municipalities move toward climate-resilient and resource-efficient water systems.

### 3. Methodology

The purpose of this review is to evaluate the application and effectiveness of smart water management technologies implemented in urban areas of Greece to address water scarcity. The review adopts a qualitative case-study methodology, analyzing three representative urban pilot projects: Paramythia (Municipality of Souli), Aigio (Municipality of Aigialeia), and Argos (Municipality of Argos-Mykines). These cases were selected based on criteria including high levels of non-revenue water (NRW), vulnerability to climate variability, and recent deployment of digital technologies.

This review adopts a qualitative case study approach, focusing on three completed municipal-level projects funded under national and European calls. Primary data were derived from project reports, academic publications, and technical specifications:

- **Paramythia (Souli Municipality):** Integrated water quality and leak detection system using a digital twin and DSS

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- **Aigio (Aigialeia Municipality):** SCADA-enabled leakage control platform with real-time visualization and sensor analytics
- **Argos (Argos-Mykines Municipality):** Smart leak monitoring stations and digital twin implementation

The selection criteria included:

- Demonstrated impact on water loss reduction
- Use of smart infrastructure (IoT, AMI, DSS)
- Involvement of academic or research partners

Each case was analyzed for its system architecture, technological setup, environmental benefits, and policy or governance frameworks. Lessons learned across the cases inform the discussion on scalability and replicability in other Greek cities.

The review focuses on the integration of Internet of Things (IoT) technologies, Advanced Metering Infrastructure (AMI), telemetry systems, and Decision Support Systems (DSS) to improve water efficiency, service reliability, and system resilience. Particular attention is paid to the institutional and technological frameworks underpinning these implementations, including:

- Digital twins and real-time hydraulic simulation models
- IoT-based leak detection and water quality monitoring sensors
- SCADA systems for operational monitoring and control
- AMI for user-side metering, consumption analytics, and billing
- DSS for predictive and scenario-based decision-making

This approach aligns with research methodologies commonly applied in the evaluation of urban smart infrastructure deployments. For instance, water management strategies using digital twins in European cities emphasizes the need for scenario-based performance evaluation, particularly in aging or semi-arid urban environments (Nydrioti et al. 2024). Furthermore, outline a systems-oriented framework for assessing smart infrastructure integration, which has informed this study’s analytical structure (Antzoulatos et al. 2018).

Additionally, the scope included environmental and socio-economic impact assessments derived from publicly available municipal data and project deliverables. The inclusion of academic and research partners in all these cases supported the development and implementation of advanced analytical tools such as DSS and digital twins, allowing not only real-time control but also strategic planning.

Figure 2: Adoption of Smart Technologies in Greek Urban Water Projects

Figure 3: Methodological Workflow of the Review

This review seeks to provide:

- A synthesis of how smart technologies were configured and implemented
- A comparative analysis of technological performance, cost savings, and water savings
- Insight into policy frameworks, funding mechanisms, and stakeholder engagement
- Lessons learned for upscaling and replication in other urban areas

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The outcomes from the selected case studies will be contextualized within the broader challenges of Greek urban water systems, as identified in Chapters 2 and 3.

### 4. Case Study Analysis

This chapter presents a detailed analysis of three municipal-level pilot projects in Greece which are examples of the application of smart water technologies to address water scarcity. These case studies provide information on system architecture, technical implementation, operational outcomes and institutional collaboration. The pilot cases vary in terms of geographical characteristics, population size, water network complexity, and technical configuration. Nevertheless, they reflect common strategic goals: optimizing water efficiency, addressing non-revenue water (NRW), improving operational decision-making, and increasing long-term system resilience.

#### 4.1 Paramythia (Municipality of Souli)

The Municipality of Souli implemented the “Smart Green Leakage Control and Water Quality Monitoring System” in the town of Paramythia, a region suffering from one of the highest levels of NRW in the country—up to 72%. The project aimed to improve water resource efficiency, reduce leakages, and ensure high-quality drinking water through advanced monitoring and simulation technologies.

Key components of the system include:

- Three local control stations equipped with real-time sensors monitoring flow rate, pressure, residual chlorine, turbidity, temperature, pH, and conductivity
- Development of a digital twin for the closed-zone water distribution network
- Virtual sensors for detecting hidden leakages
- A Decision Support System (DSS) that integrates real-time data with hydraulic modeling for operational optimization (Chasiotis et al. 2023a)

The integration of virtual and physical monitoring enabled continuous control of both quantity and quality indicators. Advanced leak detection algorithms allowed early identification of anomalies, which reduced the response time and improved maintenance scheduling. Similar methodologies have been described in studies examining the role of smart platforms in small and medium-sized municipalities (Dandy et al. 2022).

**Outcome Analysis:** The project achieved a substantial 35% reduction in NRW and ensured real-time water quality compliance. Operational expenditures were reduced, while public trust in municipal services increased. Moreover, the combination of Greek and Norwegian institutional partners fostered transnational collaboration and research transfer. The upgrade allowed for more resilient summer-period operation, addressing peak demand challenges in this mountainous community. A noteworthy aspect is the strategic value of DSS integration, which allowed for not only real-time leak localization but also the dynamic optimization of pumping schedules and network pressures. These capabilities are instrumental for areas like Paramythia, where infrastructure was outdated, and terrain variability complicates hydraulic operations.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### Outcomes:

- Estimated annual water savings: 600,000 m<sup>3</sup>
- Estimated cost savings: €20,000/year
- Reduction in non-revenue water in the city of Paramythia (NRW): ~25%
- Number of direct beneficiaries: 3,032 citizens (8,767 including the broader municipality)
- Improved environmental status of monitored water body

### 4.2 Aigio (Municipality of Aigialia)

In Aigio City, which's water losses reach up to 48%, a smart leak detection system was developed to modernize the municipal network. The pilot project extended the already installed internal leakage control system, integrating SCADA-based control with real-time sensor data and hydraulic simulation models.

Key components of the system include:

- Platform for real-time data visualization and leak detection
- Hydraulic modeling of the closed-zone network using a digital twin
- Pressure and flow rate sensors to support proactive maintenance

This case illustrates how digital platforms can support equitable tariff schemes and improve operational efficiency without increasing financial burdens on consumers. According to S.H.A. Koop et al. (2019), AMI and remote sensor systems are effective in medium-scale networks for balancing user transparency with managerial control (Makropoulos et al. 2014).

**Outcome Analysis:** The installation of a fully integrated control and monitoring system allowed a more balanced distribution of water, reducing significantly response time to failure events. The tools that were implemented (SCADA and visualization platform) enabled the local water operation enterprise to transition from a reactive to a proactive operational model. Combining pressure regulation and reduced pumping hours, the intervention also resulted in energy savings and lower greenhouse gas emissions from pumping stations. In addition, the project contributed to a more transparent interaction between users and the utility through consumption profiling, while the digital twin assisted with operational simulations for future infrastructure planning.

Estimated outcomes:

- Water saved: ~600,000 m<sup>3</sup>/year
- Cost savings: ~€21,000/year
- Noticeable drop in undetected leak events and consumption anomalies

### 4.3 Argos (Municipality of Argos-Mycenae)

In Argos city, which is facing NRW levels up to 54%, smart technologies were applied to update a deficit water balance network. This pilot case included local monitoring stations and real-time telemetry to ensure high service standards and support equitable resource pricing.

Core elements of the system:

- Installation of smart leak detection sensors in critical network points
- Development of a digital twin of the water network

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- DSS integration for real-time operational and billing decisions

Argos is a representative case for semi-arid, agriculturally intensive municipalities facing increasing pressure on water supply due to groundwater over-extraction and climate-induced variability. The real-time monitoring system enabled better protection of vulnerable water sources. These capabilities are essential for long-term planning in urban water systems (Antzoulatos et al. 2018).

**Outcome Analysis:** This project not only reduced natural losses, but also enabled the smart allocation of resources in an urban-rural dual-use context. The system's predictive capability has helped reduce over-extraction and seasonal overcharging of aquifers. As a result, Argos has been able to improve water quality and mitigate the risks of salt intrusion. In addition, increased metering accuracy has helped the municipality move towards fairer pricing models that reflect actual consumption. In addition, the project yielded operational agility by facilitating coordinated decision-making between technical staff and local government, making Argos a testbed for regional replication under similar climatic and topographic pressures.

Estimated outcomes:

- Water saved: ~1,200,000 m<sup>3</sup>/year
- Cost savings: ~€42,000/year
- Beneficiaries: 22,209 residents

**Comparative Summary:** All three case studies demonstrated:

- Effective reduction in non-revenue water
- Deployment of integrated smart systems (IoT, telemetry, DSS)
- Tangible environmental and economic benefits
- Strengthened institutional and academic collaboration

The success of these implementations underscores the replicability of smart water solutions in other Greek municipalities facing similar structural and climatic challenges.

The comparative analysis of the three pilot projects in Paramythia, Aigio and Argos reveals important insights on how smart water management technologies can be adapted to different urban environments. Despite differences in geography, population density and legacy infrastructure, all three municipalities demonstrated measurable improvements in operational efficiency, water conservation and service delivery.

### **Common Outcomes:**

- All cities reported significant reductions in non-revenue water (NRW), with total annual savings ranging from 600,000 m<sup>3</sup> to 1,200,000 m<sup>3</sup>.
- Technological integration (IoT, digital twins, DSS, and SCADA) played a central role in enabling proactive leak detection and informed decision-making.
- Financial savings ranged from €20,000 to €42,000 annually, reflecting not only lower losses but also reduced operational and energy costs.
- Each project achieved high levels of community impact, improving water security for 3,000 to over 22,000 residents.

Figure 6: Initial Leakage Rates before implementation

### 5. Key Insights

**5.1. Reduction of Non-Revenue Water (NRW):** All three municipalities achieved substantial reductions in NRW, ranging from 35% to over 50%. This result confirms earlier findings that digital water monitoring systems equipped with real-time sensors and hydraulic modeling can effectively reduce natural and apparent water losses. At Argos, the deployment of AMI contributed to pricing accuracy and better demand-side management, enhancing retention.

**5.2. Enhancement of Operational Efficiency:** The use of Decision Support Systems (DSS) in all three cases enabled the operators to move from reactive to predictive and adaptive management strategies. With DSS synthesis sensor data and simulation models, municipalities achieved improved pressure control, optimal pump scheduling and faster leak detection.

**5.3. Environmental and Energy Gains:** All three systems contributed to reduced energy use, with shorter pump duty cycles and improved pressure regulation. Smart water networks significantly reduce GHG emissions when integrated with effective pressure management (Dandy et al., 2022). The environmental benefit was particularly evident in Argos, where over-extraction from aquifers was minimized due to better water metering.

**5.4. Cost Savings and Economic Efficiency:** Annual financial savings ranged from €20,000 to €42,000, with cost recovery depending on project scale and key deficiencies. This evidence confirms research that smart metering and leakage reduction programs lead to rapid return on investment when coupled with improved pricing structures and lower maintenance needs (Cominola et al., 2015).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**5.5. Technological Flexibility and Modularity:** Each city deployed a combination of technologies based on its local needs. Paramythia emphasized water quality and virtual sensing, Aigio focused on SCADA integration, while Argos deployed AMI for end-user analytics. This variation underscores the modular nature of smart infrastructure and the ability to scale solutions progressively—a critical insight for municipalities with limited budgets.

**5.6. Institutional Collaboration and Innovation:** All three pilots included research partners—ranging from national universities to international institutions—playing a vital role in digital twin development, algorithm refinement, and DSS configuration. These collaborations ensured access to scientific tools and training, reflecting the broader recommendation by S.H.A. Koop et al. (2019) on the importance of cross-sectoral partnerships for digital transformation in water utilities.

**5.7. Social Impacts and Consumer Trust:** Improved service reliability, water quality, and equitable billing reinforced citizen satisfaction. In smaller communities such as Paramythia, where water supply challenges historically affected public trust, the visibility of smart technologies and real-time monitoring strengthened institutional legitimacy and public engagement in conservation behaviors.

In summary, these cases collectively demonstrate that the adoption of smart water technologies in Greek cities leads not only to measurable savings and efficiencies but also to more resilient, transparent, and adaptive governance models. The upcoming section will explore policy-oriented recommendations for scaling these innovations across the national water sector.

## 6. Key Differences:

**6.1. Scope and Prioritization of Technologies:** While all three cities integrated digital twins and DSS platforms, the specific technologies prioritized varied significantly. Paramythia invested heavily in water quality monitoring (e.g., turbidity, residual chlorine) alongside leakage detection, reflecting its mountainous location and quality concerns. In contrast, Argos emphasized customer-side analytics through AMI, addressing large-scale water losses and the need for billing transparency in a mixed urban-agricultural context (Makropoulos et al., 2017). Aigio adopted a robust SCADA backbone to modernize network control, with real-time data visualization being a primary operational enhancement.

**6.2. Network Complexity and Legacy Infrastructure:** Argos managed a more complex and spatially extensive network, requiring a more distributed telemetry configuration and a larger number of pressure zones. Paramythia, though smaller, faced severe topographical challenges and older infrastructure, necessitating virtual sensor integration to complement sparse physical instrumentation. The differences in those system conditions affected the design choices and rollout timeline of each solution (Antzoulatos et al., 2018).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**6.3. Volume of Water Saved and Financial Returns:** Argos demonstrated the highest absolute volume of water savings (though leakages) and cost benefits due to scale and baseline inefficiencies. While Paramythia and Aigio achieved similar volumetric savings, the per capita benefit in Paramythia was proportionally higher, demonstrating the relevance of smart technologies even in small municipalities.

**6.4. Institutional Capacity and Local Governance Models:** Aigio City’s pilot project featured higher levels of operational autonomy within the local water enterprise (DEYA), enabling quicker system reconfiguration and workforce adaptation. Paramythia City, on the contrary, relied more on external expertise and inter-municipal cooperation, reflecting the resource limitations of smaller municipalities. Argos benefited from political continuity and integrated planning between departments, facilitating alignment between technological and policy objectives.

**6.5. Data Granularity and Use in Planning:** The granularity of data use also varied. In Argos, AMI enabled high-resolution demand profiles that supported demand forecasting and tariff reform. In Paramythia, data primarily supported operational alerts and reactive maintenance, with limited downstream planning use. Aigio leveraged SCADA for near-real-time response and asset performance monitoring but did not include consumer-side metering during the project phase.

**6.6. External Collaboration and Research Partnerships:** All three pilots collaborated with academic institutions, but the depth of involvement differed. Paramythia had the most comprehensive research integration, with three universities involved in digital twin modeling, DSS development, and virtual sensing. This facilitated deeper innovation and technical validation, which smaller municipalities often lack the capacity to develop independently (Chasiotis et al., 2023a).

**6.7. Communication and User Engagement:** User interaction varied across cases. Argos leveraged smart metering data for improved communication and awareness among citizens. Paramythia promoted transparency through municipal announcements and real-time monitoring displays, increasing public trust. Aigio focused more on internal operations, with future plans to scale communication features.

These differences illustrate that the pathway to smart water management is not one-size-fits-all. Instead, success depends on adapting technological choices to local priorities, institutional readiness, infrastructure conditions, and governance models. This highlights the importance of flexible frameworks that allow for context-sensitive innovation while maintaining core principles of integration, interoperability, and long-term sustainability.

## 7. Challenges Identified

Despite the demonstrated benefits of technologies (like IoT, DSS and DT) in those Greek case studies, several critical challenges persist that may hinder widespread adoption and long-term

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

sustainability. These challenges span across technical, institutional, financial, and social domains, and must be addressed in order to scale smart urban water solutions effectively.

### ***7.1. Technical Integration and Interoperability***

Many municipalities struggle with integrating new technologies into outdated water infrastructure. Legacy systems often lack the capacity to support real-time monitoring or automation, requiring significant upfront investment for upgrades (Romano, M. et al., 2014). In Paramythia, for instance, the introduction of digital twins and virtual sensors necessitated a parallel upgrade in hydraulic models and local data management protocols.

### ***7.2. Data Governance and Cybersecurity***

As smart systems rely mostly on online data collection and cloud-based platforms, concerns over data ownership, cybersecurity, and interoperability remain underregulated. The absence of standardized data frameworks, most commonly in Greece risks data fragmentation and potential vulnerabilities in real-time water management systems.

### ***7.3. Financial Constraints and Uneven Access to Funding***

Smaller municipalities, such as Paramythia, face greater difficulty accessing the capital required to invest in advanced technologies. While EU and national co-financing mechanisms have supported pilots, the long-term financial sustainability of these systems is uncertain without dedicated operational budgets or performance-based funding schemes (Chasiotis et al., 2023a).

### ***7.4. Institutional Fragmentation and Capacity Gaps***

Water utilities in Greece often operate with limited staff, outdated training, and bureaucratic rigidity. The lack of coordination between technical departments, local authorities, and external consultants impedes efficient deployment of smart solutions. Argos and Aigio both reported delays due to administrative approvals and limited staff familiarity with IoT platforms and hydraulic simulation software.

### ***7.5. Limited User Engagement and Awareness***

Although smart systems offer opportunities for behavioral change through personalized feedback and leak alerts, public engagement remains minimal. In Aigio City the benefits of SCADA and real-time information were invisible to end-users. Without communication campaigns, users most likely may not support or fully utilize smart services, reducing their overall effectiveness.

### ***7.6. Environmental Constraints and Climate Uncertainty***

While smart technologies enhance operational adaptability, their effectiveness is still limited by external factors such as drought, aging aquifers, and urban sprawl. In Argos, over-extraction of groundwater remains a long-term threat, despite improved control and monitoring of leaks. Climate variability can also compromise the accuracy of forecasting algorithms without constant recalibration and data enrichment.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### **7.7. Scalability and Long-Term Maintenance**

Many pilots rely on grant-based funding for their initial deployment but lack long-term operational strategies. Ensuring system continuity, hardware maintenance, and software updates over time presents a considerable logistical and financial burden. Without institutionalized monitoring and reinvestment cycles, these systems risk degradation and underperformance.

In conclusion, while the three Greek case studies validate the potential of smart water solutions, they also underscore the need for robust enabling environments that combine technological, regulatory, and societal innovation. Addressing these challenges is essential to move from isolated pilot projects to widespread, sustainable urban water management practices.

## **8. Conclusions**

### ***Conclusions and Future Work***

Smart urban water management systems leverage an ecosystem of advanced technologies – from pervasive IoT sensors and Advanced Metering Infrastructure (AMI) to real-time control through SCADA, high-fidelity Digital Twins and data-driven decision support systems (DSS). The integration of these elements has begun to transform traditional water utilities into "smart water networks", enabling unprecedented visibility and control over urban water infrastructure (H.M. Ramos, et al. 2019).

This chapter summarizes the global state-of-the-art in these technologies, compares international implementations, and outlines future directions. Emphasis is placed on the **performance gains, integration strategies, and scalability** of such systems in real-world urban settings.

### ***Smart Technologies for Urban Water Management***

Recent years have seen rapid adoption of digital technologies in water distribution networks. **IoT-based sensing** is now central to monitoring water systems: utilities deploy networks of smart pressure, flow, acoustic and water-quality sensors across pipelines and assets. These sensors provide continuous, high-resolution data on system conditions (e.g. pressures, flows, water quality) in real time (Ramos, et al. 2019). For example, Singapore’s Public Utilities Board (PUB) has installed *hundreds* of multi-parameter sensor probes (measuring pressure, flow, acoustic and quality indicators) to continuously detect leaks and water quality issues across its island-wide network. **Advanced Metering Infrastructure (AMI)** – large-scale rollout of smart water meters to customers – similarly offers fine-grained consumption data at hourly or sub-hourly intervals. A growing number of water utilities, especially in the USA and Europe, have implemented AMI to capture detailed usage information from millions of customer meters (Water Research Foundation. 2020.). This wealth of data enables better demand forecasting, quick detection of anomalies (like continuous flows indicating leaks), enhanced customer engagement in water conservation, and more effective policies to reduce non-revenue water. Notably, AMI data proved invaluable during the COVID-19 pandemic to analyze shifting consumption patterns and inform operations (Krishnan, et al. 2022).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**SCADA systems** (Supervisory Control and Data Acquisition) remain the backbone for water utility operations, providing remote monitoring and control of pumps, valves, reservoir levels, and treatment processes. Modern smart water architectures increasingly integrate SCADA with IoT sensor networks and AMI data, moving from isolated operational control to unified data platforms. This integration is key to achieving real-time management: field sensor and meter data feed into central hubs where they are combined with Geographic Information Systems (GIS) and asset databases. In an exemplary smart distribution network in Spain, a central software platform integrates **remote meter readings, GIS maps, SCADA telemetry, and water quality sensor data**, applying anomaly-detection algorithms (including demand forecasting models) to flag leaks or quality issues in real time. The result is a “digital nerve center” that can alert operators to events like bursts or contamination and even initiate automated responses (such as valve closures) to mitigate incidents (Public Utilities Board Singapore, 2016).

### Future Directions for Smart Water Management

The global trend toward smart water networks is unmistakable and likely irreversible. Moving forward, several key areas of development and research will shape the **next generation of smart urban water systems**:

- **Interoperability and Standards:** To fully realize scalability, the industry must converge on open standards for data and device integration. Standard communication protocols and data models would enable plug-and-play addition of new sensor types and analytics modules. Developing a **systematic framework** for smart water architecture (as called for by recent studies ) will be crucial so that utilities can follow proven blueprints rather than ad-hoc designs. This includes common definitions of data “layers” (from instruments to application layer) and shared metrics for evaluating smart system performance (such as the “smartness” and “cyber-wellness” metrics proposed in literature ).
- **Advanced Analytics and AI:** As data quantity and quality increase, machine learning and AI will play a larger role in water management. Future systems will use **predictive analytics** not only to anticipate leaks or demand spikes but to enable truly **autonomous** control in certain aspects. For example, AI could optimally regulate pressures by learning from historical patterns, or perform real-time water quality anomaly detection using pattern recognition beyond human capability. Early steps in this direction are visible – e.g. some utilities already use AI-based demand forecasting and anomaly detection algorithms– but there is ample room for growth in AI-driven decision support, including the integration of generative AI for scenario planning in digital twins.
- **Digital Twin Enhancement:** Digital twin technology is expected to mature into a core operational tool. Current digital twins primarily mirror hydraulic behavior; future twins may integrate more dimensions (e.g. water quality chemistry models, asset degradation models, financial models for asset management). This would allow holistic decision-making (e.g. choosing an optimal pipe replacement not just on hydraulic performance,

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

but also considering water quality impact and life-cycle cost). Greater fidelity and real-time coupling between the twin and field data (via IoT) will move utilities closer to a **“living” model** of their network that is always synchronized with reality . Moreover, linking water digital twins with other urban system twins (energy, wastewater) could unlock cross-sector optimizations in smart cities.

- **Cybersecurity and Reliability:** As water systems become cyber-physical systems, ensuring their security and reliability is paramount. Future work will focus on robust cyber-security measures to protect sensor networks and control systems from hacking or sabotage. Similarly, building redundancy in communications (multiple pathways for critical control signals) and fail-safes in automated control is critical so that increasing automation does not compromise the fundamental reliability of water supply. Research into **resilient system architectures** and anomaly detection for cyber threats is underway as part of making smart water systems safe against new failure modes .
- **Socio-Technical and Organizational Aspects:** A truly sustainable future for smart water management also depends on human and organizational factors. Utilities will need to invest in workforce training – transitioning from traditional operational roles to data-centric roles – and in public communication. Early projects (like Singapore’s) found that staff roles had to evolve and public acceptance of technologies (e.g. smart meters, which sometimes raise privacy concerns) had to be managed . Future research might explore change management, customer engagement strategies, and policy frameworks that facilitate technology adoption (for example, regulations for data sharing and privacy, or incentive schemes for utilities to reduce leaks using smart tech).

In conclusion, smart urban water management systems have demonstrated clear technical advantages and operational benefits in cities around the world, from reducing water losses and energy usage to improving service continuity and decision-making. The global context reveals a spectrum of adoption: some cities (e.g. Singapore) now operate large-scale integrated smart water grids, while others are in pilot phases, gradually upgrading aging infrastructure with smart sensing and control. The coming years will likely see these technologies become standard practice, supported by more refined integration frameworks and powerful analytics. As utilities continue to share knowledge (through pilot projects and research) and technology costs decline, we can expect the performance gaps between “smart” and “non-smart” water systems to drive widespread investment in digital solutions. Ultimately, the future water utility may function as a fully data-driven, self-optimizing network – a digital twin of the physical system that continually adjusts itself to deliver reliable, safe, and efficient water service. Achieving that vision will require continued innovation and collaboration across disciplines, but the substantial progress documented to date provides a strong foundation for these future developments.

**Special session:**

### **LANDSCAPE AND URBAN SUSTAINABILITY: DISCUSSING THE NATURAL AND SOCIO-CULTURAL FACTORS, IN A POSITIVE OR NEGATIVE MOOD**

Coordinator:

**Dr. Konstantinos Moraitis**  
*Professor Emeritus N.T.U.A.*  
[mor@arsisarc.gr](mailto:mor@arsisarc.gr)

#### **Content:**

We could not discuss and afford sustainability, place-centered sustainability in particular, outside the socio-cultural factors implied by it.

It is in this context of a combined cultural landscape that the natural and social approaches are intensively associated. Cultural landscape in urban or extra-urban formations presents the necessary coexistence, the necessary combination of both groups of influence: no natural ‘more than human’ landscape factor may exist outside the consequences of social and cultural impact. What kind of impact, what kind of influence, nevertheless? Material or immaterial, real or imaginary, positive or negative?

Is landscape interest associated with the ‘flourishing’ of positive cultural apperception, of the ‘emerald necklaces’ and green ‘park movement’ imagery, or with the terrifying aspect of a decaying natural or urban terrifying landscape? Did ‘Les Fleurs du Mal – The Flowers of Evil’ by Charles Baudelaire, blossom in the same urban landscape of the Parisian 19th century parks’ positive intervention? Conclusively: how can we critically comment on the negative social imaginary, or enforce the positive social correlation with natural peri-urban landscape and, especially, with urban public landscape?

**Key Words:** Cultural landscape, cultural sustainability, political sustainability, urban public space, real space social contact, virtual space guidance.

**OPEN-AIR CITIES: COMMON APPROACHES FOR BUILDING,  
LANDSCAPE AND URBAN-SCAPE DESIGN - THE CONCEPT OF  
DESIGN SCHEMATIZATION**

**Abstract**

It is normal to present, in conferences like the one under the subject “Open-Air Cities,” completed design or built projects. We scarcely discuss methodologies that could offer a didactic approach for students or professional architects. It is against this approach that we shall propose a methodology that could help designers, experienced in architectural projects, to transform their skills and compose, in a way analogous to their building-design awareness, landscape formations with intense plantation ‘green’ identity. To this first approach, we shall add a second one, insisting on the fact that building envelopes may be formed as continuations of the surface of the surrounding landscape. They may be conceived as a “metaphor” of topological folds that could compose open-air landscape formations and building or hard-scape urban structures as well.

The concept underlying the previous didactic or auto-didactic approach has to do with the idea that we do not design and compose reality in its full detailed complexity: building reality, landscape reality or urban-scape reality. What we design and compose is a structured, “schematized” interpretation of the real place formations, an “abstract” schematized interpretation of it; unimportant details have been abstracted, and the remaining principal important characteristics have been restructured in a new conceivable and trustworthy to be applied form.

**Moreover, we shall insist in our presentation on the idea that abstract schemes, in all previous design cases and all previous thematic and scale design approaches, may have common formal references. Building design, landscape design or urban design may be composed on a common or relative conceptual ground of abstract schematized principles, able to produce our “Open-Air Cities” context of compound “landscape urbanism.”**

Plus, a final comment: In which way urban landscape schematization may be positively transformed?

**Keywords:** Schematism, Schematization, abstraction, architectural design, urban design, landscape design, landscape urbanism, didactic methodologies, theory of knowledge, expressive metaphor.

---

It is normal to present, in conferences like the one under the subject ‘Open-Air Cities’, completed design or built projects. We scarcely discuss methodologies that could offer a didactic approach for students or professional architects. It is against this approach that we shall propose a methodology that could help designers, experienced in architectural projects, to transform their skills and compose, in a way analogous to their building-design awareness, landscape formations with intense plantation ‘green’ identity. Or we may extend this methodological approach and refer to the earth surface and extend it to create building shells, building envelopes, in a compositional approach analogous to that applied in open-air design projects.

**Img. 1:** A central square in Trikala principally organised through the use of plantations. The project was awarded as the winning proposal of the respective panhellenic architectural competition in 2019, and it is now under construction. The design team was composed of the architects: K. Apostolidis, T. Karachalios, S. Karachalios, L.-M. Belemezi, K. Moraitis, K. Helidoni.

The concept underlying the previous didactic or auto-didactic approach has to do with the idea that we do not design and compose reality in its full detailed complexity: building reality, landscape reality or urban-scape reality. What we design and compose is a structured, “schematized” interpretation of the real place formations, an “abstract” schematized interpretation of it; unimportant details have been abstracted, and the remaining principal important characteristics have been restructured in a new conceivable and trustworthy to be applied form.

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### Initial introductory comments

*Moreover, we shall insist, in our presentation, on the idea that abstract schemes, in all previous design cases, and all previous thematic and scale design approaches, may have common formal references. Building design, landscape design or urban design may be composed on a common or relative conceptual ground of abstract schematized principles, able to produce our “Open-Air Cities” context of compound “landscape urbanism.”*

Plus, one additional introductory comment: In which way urban landscape schematization may be positively transformed?

In which way a supposedly “enclosed” formation, what we describe as “a building,” could be open to the surrounding “open-air” urban scape. In our next image [Image 2], we refer to two emblematic structures by Ludwig Mies Van der Rohe. The *Neue Nationalgalerie of Berlin*, on the left, a cultural building that intended to be open to the city, and on the right, his initial approach of an analogous intention, the famous early 20<sup>th</sup> century avant-garde proposal of the *Barcelona Pavilion*. Insisting on the second project, I may ask: is it a building or a landscape formation, pre-iconizing the contemporary design term “landscape formation” that is used under different formal approaches in closer to us architectonic proposals?

**Img. 2:** The house (or rather the building), as the city, as the landscape. The *Neue Nationalgalerie of Berlin* by Ludwig Mies Van der Rohe (on the left) and the early 20<sup>th</sup> century avant-garde proposal of the *Barcelona Pavilion*, again by Mies Van der Rohe (on the right). The Pavilion could surely be described, using closer to us terms, as a “landscape formation.”

In the next image [Image 3], I insist on the structural decomposition of the Barcelona Pavilion in correlation with a statement by Leon Battista Alberti: “... *as philosophers also admit, the city could be compared to a large house, and the house, in its own turn, could be compared to a small town...*” I could add, “*as architects may also admit.*” How can I decipher the previous statement? Probably insisting on the fact that we may find common schematized, abstract design principles, under the compositional approaches of differentiated design subjects of different scales. In an arrogant way, I have tried to transform the initial design scheme of the Pavilion project into a garden-like proposal or into two hard-scape urban

## PROCEEDINGS

2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025

---

scape proposals of differentiated geometry. Under all three experimental approaches, a common initial abstract schematized reference exists.

**Img. 3:** In this image, I have tried to transform the initial design scheme of the Pavilion project (upper left), in a garden-like proposal (bottom left), or in two hard-scape urban scape proposals of differentiated geometry (right side of the image).

Immanuel Kant and Jean Piaget, each one in his own way, explained this mental achievement of abstraction and schematism or schematization, and Friedrich Froebel, the initiator of the “Kindergarten,” tried to use this theoretical approach, concerning cognitive abstraction and schematization, as a didactic method for the education of the young children.

**Img. 4:** Immanuel Kant (1724 –1804) and the theory of “Schematismus”, in his *Critic of Pure Reason* (upper left). Jean Piaget and his own theory of “Schématisation” (bottom left). Friedrich Fröbel (1782-1852) and his “Garden for the Children – Kindergarten.” Froebel’s educative approach prioritized the geometrical structural abstraction and its reference to nature (right). I perceive reality... I abstract all details, which are not necessary for my present activity... and then, while approaching again reality, I am reforming my decisions in such a way that the result of my mental formation or my design approach would be easily applied and more successful. *Furthermore, I conceive the house, as the city, as the landscape, probably in the same way that I try to conceive cosmic totality.*

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

A number of important modern painters or architects were taught or instructed on a methodology for the creation of abstract and schematized forms, through the didactic methods of Fröbel’s kindergarten. We may enumerate Wassily Kandinsky, Frank Lloyd Wright and Le Corbusier. Piet Mondrian was an instructor in a Froebelian kindergarten, as was Johannes Itten, who organized his “Vorkurs,” his introductory lessons for Bauhaus first-year students, in accordance with Froebel’s didactics.

### My motive

...has to do with the design of landscape in the same schematized and abstracted way that I design buildings. Thus, my motive refers to an autodidactic method, for landscape or urban-scape design, in accordance with what I already know: building architectural composition. It is surely important to participate in high-level conferences, presenting high-level texts about “open-air” public places, or final well-promoted projects in seductive 3D presentations, BUT how can I teach myself about the central compositional approaches? My text displays a didactic proposal, which I have introduced firstly in my postgraduate courses at N.T.U.A. and, afterward, after the theoretical formation of my approach, in the undergraduate program of the School of Architecture at N.T.U.A.

**Img. 5:** Klathmonos Square in Athens: transforming the initial symmetrical formation to an asymmetrical one, using, as depicted in the next Image 6, urban plantation or open-air urban “hard” structures, or “mixed” proposals.

### Exemplary students’ projects, in undergraduate design lessons

Let us offer a simplified approach to this methodology, as introduced in an undergraduate lesson, concerning the intervention at the Klathmonos Square in Athens. You may see abstract diagrammatic analyses of the place [Image 5], and a sketch of a compositional comparison between abstract geometrical forms and compositional formations of plantation, of different volumes and colours - *different volumes and colours composed* [Image 6].

**Img. 6:** Usage of urban plantation or open-air urban “hard” structures (upper exemplary sketches), or “mixed” proposals (bottom sketch), to transform the initial symmetrical formation to an asymmetrical one,

Let us insist on the previous diagrammatic approaches of the square using urban plantation or open-air urban “hard” structures, or “mixed” proposals, and compare them to an exemplary students’ proposal for the square insisting on the flooring material structure of the square AND on the composed plantation formations of it [Image 7] <sup>65</sup>

In Image 9, we present analogous schematized approaches, concerning a building-oriented urban-scape design (on the left), and open-air landscape design using schematization of plantation elements (on the right). We may go on and present a combination, a combined compositional effect, a compositional synergy between hard building urban scape, and urban plantation. ***Hard scape building formations and green-scape formations may be correlated and composed in an analogous schematized way*** [Image 10], ***as presented in the example of a 9<sup>th</sup> semester lesson concerning urban intervention at the territory of Plato’s Academy.***

**Img 9:** Analogous schematized approaches applied in pre-graduate students’ proposals in the School of Architecture at N.T.U.A. Building oriented design of “hard scape” composition (upper example – 7<sup>th</sup> and 8<sup>th</sup> semester lesson), and open-air landscape design using schematization of plantation elements (bottom example - 7<sup>th</sup> and 8<sup>th</sup> semester lesson).

**Img 11:** Trans-thematic and trans-scale design approaches by Zaha Hadid and Zaha Hadid Architects. A sequence of design experiments on different scales of approach, indicating common design principles, a common expressive code of design response. Upper row from left to right - *The Peak Leisure Club* in Hong Kong, China (1983), *Landscape Formation One*, a garden pavilion, in the city of Weil am Rhein in Germany, (1999) and *The Masterplan of the City of Appur* in India (2008). Bottom row from left to right - *Stuart Weitzman Flagship Store*, Milan, Italy (2013) and *Celeste Necklace and Cuff*, designed for atelier Swarovski (2008).

### **Trans-thematic and trans-scale design approaches and their correlation with the conceptual and expressive procedure of “metaphor”**

In reference *to landscape formations and topological folding forms*, Zaha Hadid Architects have presented an extended number of *trans-thematic and trans-scale design approaches* (Moraitis, 2019: p. 24). In accordance with this multi-thematic formal experimentation, we shall introduce the important methodological term “metaphor” as a possibility of inspiration, transcending different expressive structured systems. We strongly believe, this is a central theoretical statement of ours, that metaphor is not an expressive condition associated with literature and poetic approaches solely. It is not solely a figure of speech (de Man, 1978 & 1999) that, for rhetorical reasons, directly refers to one thing by mentioning another. In a much more extended connotational approach, metaphoric transcription may bring together concepts from different conceptual domains, from different domains of cultural expression and activity.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

It is in the previous interpretative context that the French psychoanalyst Jacques Lacan, follows the definition of the term by the pioneer linguist and literary theorist Roman Jakobson, and accepts metaphor as the substitution of one signifier for another. We could thus identify metaphor “with the substitutive axis of language” (Evans, 1996: p. 114), and further explain that it provides a formula of the trans-conceptual and trans-expressive formation of individual cognition, as well as an important theoretical approach of the possible multiple reciprocal exchanges among different versions of the collective cultural activity. It is in the same context that we could also describe our methodological didactic approach of abstraction and schematization, as a conscious or unconscious process that underlies our expressive compositional and design correlations and produces conscious or unconscious “metaphors” between different design topics. We could be even more radical in our theoretical statement and speak about conceptual exchanges between representational practices, theoretical influences and, even, general socio-political approaches. In the case of Renaissance garden art, a constitutive economic and political change, triggered a new approach of the agrarian economy escorted by an innovative apperception of the out-of-town landscape. It was in correlation with this cultural framework that the garden art asked for its formative inspiration in the architectural building design, creating the prototype of the “stanza garden,” a vegetal room-like structure without a roof; “stanza” being the Italian term for the room, the chamber<sup>66</sup>. Analogous comments may be presented in association with the 17<sup>th</sup> Dutch apperception of the landscape or the formation of the 18<sup>th</sup> formation of the British landscape architecture.

A metaphor may thus create new links between otherwise distinct conceptual domains,<sup>67</sup> between formal approaches of different expressive activities. For example, between landscape painting and landscape architectural compositional approaches, or, as in the case of Zaha Hadid Architects, among landscape formations, building design, urban design or even interior architecture and object design. Nevertheless, an even more important metaphor, in the case of Zaha Hadid Architects, correlates all those design approaches with topological mathematics. I refer to a central contemporary epistemological and cultural tendency, “epistemic” in Michel Foucault’s terms (Foucault, 1966, 1986 & 1994)<sup>68</sup>, which characterizes scientific and expressive design domains as well. In the case of Bernard Cache’s theoretical approach (Cache, 1983 & 1995) it correlates landscape perception and landscape design, with object and furniture design and, furthermore, with topological mathematics and their computational design application. An even more revealing metaphoric connection may refer to the theoretical intersection of the topological mathematical conception with the historic-philosophical concern of the Baroque 17<sup>th</sup> century, as epitomized by Gottfried Wilhelm Leibniz’s early topological anxiety. We may expand this theoretical approach, as presented by Gilles Deleuze in his book, *Fold. Leibniz and Baroque – Le Pli. Leibniz et le Baroque* in its

---

<sup>66</sup> It also refers, figuratively, to a self-contained part of a poem, including connected thoughts.

<sup>67</sup> Whereas, another expressive correlative formation, “metonymy” relies on pre-existent links within such domains.

<sup>68</sup> “Epistemic”, in reference to the term “épistémè”, used by Foucault to express not scientific approaches solely but, moreover, the general cultural conditions, which contribute to the formation of social expression and cognition or knowledge at a given historic period.

## PROCEEDINGS

---

initial French title (Deleuze, 1988, 1993 & 2004). We may additionally refer to the deliberate deformations of the earth bas-relief of the baroque gardens in order to produce the “trompe d’œil” results of the illusionary perspective known as “anamorphosis” (Moraitis, 2017 & Moraitis, 2024: p. 89). Let us comment that the previous book constitutes a well-known reference for contemporary architects and landscape architects.

### Three Projects of personal design involvement, correlating building structures with landscape formations

In reference to the concept of the folding forms that may create a structural continuity between earth surface and building envelope, we shall dare to present three analogous proposals, three projects in which we have participated in the past. They concern *a building imitating landscape formation* [Image 12], *the concept of the continuity of the earth surface on the building structure* [Image 13 and Image 14], and *an analogous landscape folding formation applied to a building approach as a continuity to the surrounding urban scape* [Image 15].

The first project refers to the architectural proposal for the town hall for the municipality of Vocha, in Corinthia, Greece.<sup>69</sup> The town hall, proposed to be constructed at the boundary of the built area of the town of Vocha, directs its principal façade towards an extended agricultural territory, planted with orange trees. Out of this landscape of arboreal delights, the earth’s surface arises; it folds up in a horizontal direction to form the building shell. At the upper part of Image 12, a 3D aspect of the building is depicted, captured towards its principal façade. At the bottom part of the image, the idea of the schematized folding form, creating the building shell, is explained.

**Img 12:** A town hall of the municipality of Vocha, in Corinthia Greece – a proposal of a folding form, insisting on the concept of the continuity of the earth surface on a folded building structure, a building alleging that was conceived in continuity to the surrounding landscape.

---

<sup>69</sup> Designed by the members of the architectural team “Arsis Architects” (A. Chelidoni, K. Moraitis, P. Nikolaidis), in 2001-2002.

## PROCEEDINGS

---

The second project is presented in Image 13 and Image 14. It was proposed in the context of an international architectural competition,<sup>70</sup> concerning the design of a building complex for the reception and information facilities provided for the visitors, at the territory of the Giants' Causeway in Ireland. We have to remind you that the Giant's Causeway,<sup>71</sup> located in County Antrim on the north coast of Northern Ireland, is an area of forty thousand interlocking basalt columns, produced by an ancient volcanic fissure eruption. In association with this primordial volcanic earth bas-relief, the architects' design team decided that a building formation, would have to prove its respect to the identity of the exceptional Irish landscape. Thus, the reception and information complex for the visitors, was envisaged as a compound structure of two separate building wings, came forth from the surrounding terrain, their roofs described as planted surfaces.

**Img 13:** Visitors' building for Giants' Causeway in Ireland; insisting on the concept of the continuity of the earth surface on the building structure. The roofs of the two separate building wings of the visitors' facilities complex were designed as planted surfaces, as parts of the surrounding landscape, as a continuity of the green surrounding terrain.

---

<sup>70</sup> Designed by architects S. Mavrommati, A. Moraiti, K. Moraitis, M. Voreakou, in 2005. The competition was organized under the auspices of U.I.A. (International Union of Architects)

<sup>71</sup> In Irish, Clochán an Aifir.

---

**Img 15:** A landscape folding formation, analogous to the two previously presented exemplary projects, was applied to the proposal for a building complex, proposed for the Intercity Bus Station at the territory of Eleonas, in Athens. The complex is presented as the result of the detachment of two surface layers, coming out of the surrounding urban scape, in a way that would facilitate the continuous approach and circulation, on different levels, of vehicles and passengers.

**Conclusive remarks: the contemporary reference to natural landscape as an extended expressive and “epistemic” metaphor transcending different cultural domains**

According to the French mathematician, expert in topology (Thom, 1972 & 1975) and founder of the “Catastrophe Theory,” René Frédéric Thom, natural landscape may offer a satisfactory formal paradigm of reference for the description of the topological formations. *The landscape surface, the earth bas-relief under transformation, are they necessary as references to the continuous change of forms, to the “animate” forms* (Lynn, 1999)? Finally: *Is the form of landscape useful, as a visualized reference, in all research approaches interested in trans-formational and morphogenetic procedures?*

It is in this context that reference to natural landscape constitutes an extended expressive and “epistemic” metaphor transcending different cultural domains. Its correlation to building structures designed as “landscape formations” presents an analogous expressive example, important for our design interest, an expressive up-to-date example that, nevertheless, may be regarded as a current extension of our initial proposal concerning the common abstract

---

schemes underlying building and landscape design. Common abstract schemes, which enable the expressive metaphors among building design, insist on the concepts of the topological transformation and the folding forms.

#### Abstract

The modern cities, while occupying only 2-3% of the land surface, host an astonishing 55% of the world population. As IUCN states, modern cities account for a vast majority of consumption and waste production, main factors leading to the catastrophe of the environment. The lion's share of production is used to provide the big cities with even more resources, and as that need keeps growing, is leading to deforestation and expropriation of the natural environment, something that seems like the story of the death of Pan.

While inhabited, those spaces make the residents feel alone and imprisoned. A voluntary prison that seems to have no escape. Recognizing the problem, a solution that often comes up is the one of the green cities, a sustainable inhabitable place. Coming from a capitalistic perspective, whose main objective is pure profit and exploitation, this topic seems to touch the spectrum of fiction and can be considered greenwashing. The modern city keeps growing denser, while leaving no space for the inhabitants. The growth of population in those areas also leaves rural areas deserted and decadent.

In theory, a green city might prove to be a valid option, but it is of outmost importance to seek alternative ways of inhabiting spaces, focusing on less density and more means of primary production, distributed as evenly as possible. The importance of the natural environment and the connection of the people with it can prove crucial for the protection of the planet and the growing problem of alienation that the modern human keeps facing. This solution can prove helpful, not only for the environment, but also for the better habitation of people in those areas.

**Key words:** Green cities, greenwashing, environmental catastrophe, Urban revision

#### Introduction

The summer of 2024 was the hottest summer recorded in the northern hemisphere, marking severe climate anomalies globally. While these phenomena are becoming a new reality, creating new challenges of inhabitation in human settlements worldwide, the social, economic and political structures seem to disregard the constant change, while focusing on marketing capital, using climate change, or catastrophic natural phenomena, to promote new ways of technocratic control. This disregard of human living conditions and the exploitation of resources keep pushing the limit of the need for a constant growing cityscape around the world. There is an importance of recognizing the evident problems that lead to this kind of phenomena and proposing new solutions. While solutions keep focusing on market gain or

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

mildly modifying the cities as a façade to seem more environmentally and resident friendly, the problems that come with urbanization and modern cityscapes will keep recycling.

### **The parasitic nature of modern cityscapes**

The modern cities host more than 4.4 billion people worldwide, making them home to 55% of the human population. This rate reveals its dire nature when, in the current state, modern urban environments are responsible for 75% of natural resource consumption, 80% of energy consumption, 70% of greenhouse gas emissions and 50% of waste production, while only covering 2-3% of the global land surface. This percentage is rapidly increasing, with studies showing that by 2050, the total number of residents in urban environments will rise to 6.7 billion, leaving non-urban, rural and natural land masses deserted.

A problem that can be detected here is that the modern city has become a place of constant demand of resources, while the only production it is capable of offering is waste. A wasting condition occurs, constantly draining everything around it, like a parasitic entity, that has a never-ending demand for supply into a vast host, leaving earth depleted. The reality is the severe threat of climate breakdown and ecological collapse. The uncontrollable expansion of means of energy production, combined with vast acres of land expropriated, is depleting the natural resources by destroying the natural environment to perpetuate capital to the main technocratic powers.

Combining these data, one can easily realize that the perpetuation of urbanization has created a demand for resources that greatly overcomes the total production, leading to constant drain of resources. This observation can also be traced by example, if the tracing is focused on specific fields regarding the usage of urbanized, or rapid developing areas. Along with the resource depletion, urbanization also leads to cultural and social consequences, such as the commercialization of the public space.

An aspect that plays a significant role, for example, is the ever-growing field of tourism and hedonism. While living in an era that can be characterized as the peak of urbanization, the demand for capital gain keeps pushing further into the commercialization of every aspect of life inside cityscapes. The public spaces are shrinking, in favor of commercial development demand. This phenomenon, alongside other multiple factors, also affects the market value of housing, making it almost impossible to keep the average citizen up with the ever-growing development of urban areas. This is most evident in extreme cases, such as Mumbai, India, where 60% of the population is living in slum areas. Mumbai is a city where the income divide is most visible and can signify the importance of action against modern development.

This topic is difficult to summarize fully on paper, but even this fraction of stats and evident matters tracing can provide anyone with enough information that proves that action is necessary. While the connection of the natural environment and the protection of it is an expanding area, when it is combined with cityscapes and human settlements, reveals an evident fact. In the grand scheme of the planet, time, space and resources occupied by humans are almost insignificant. Humans have occupied the planet for only 0.008% of its 3.7-billion-year history, while the planet is in a constant state of metamorphosis. What makes this matter so important is that it affects the living environment in this period. Ecology is much more than “saving the planet”, but it can be characterized by making the best living conditions for the existence of human lives. The factor of ecology, the need for open-air cities and resource

## PROCEEDINGS

---

diversification and better distribution is vital in creating better living conditions for all humans in the present.

### **The “Green City” concept**

The urgent need to address these matters has led to a consecutive search for solutions and catalysts. One commonly discussed concept is modifying the existing cityscapes and creating new urban areas with certain characteristics. This concept refers to Sustainable cities. Green cities (or sustainable cities) are typically characterized by their focus on certain features that divide them from a typical urban area, usually associated with environmental protection and restoration driven goals.

The UN Environment Programme focuses on maintaining the economic growth of the cities while creating sustainable and livable solutions, focusing mainly on cities in Asia and the Pacific. The prospect of resource efficient and healthy cityscapes seems appealing and a step in the right direction. The sustainable cities, in theory, seem to have some key characteristics.

- The presence of green spaces within the urban environment
- The use of renewable energy sources, such as wind turbines, solar panels, and biogas.
- Sustainable architecture is also a significant aspect, exemplified by green roofs and the use of eco-friendly materials.
- The integration of green ‘islands’ through the urban fabric, utilizing resilient plants or xeriscaping, is another innovative approach.
- Lastly, the emphasis on creating more open spaces contributes to the overall sustainability of the city

Those are some of the main factors that deem the city, Green. If the above factors are seen as a register, some key points can be observed. While these characteristics define sustainable cities, there are important shortcomings to consider:

- While the main focus is on city density, with proposals such as open green areas, this approach does not address the housing crisis or improve conditions in slum areas.
- Although there are proposals for resilient plants or xeriscaping, they overlook the importance of natural biodiversity, which is essential for a healthy ecosystem.
- While renewable energy sources like wind and solar power are beneficial, they are often located in rural areas, which can result in the destruction of natural habitats. This can result in the destruction of large natural areas and the disturbance of local ecosystems.
- Sustainable architectural practices may prove effective, but they will not provide lasting benefits without regulations that protect natural landscapes and control excessive tourism.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- While open spaces in cities are generally positive, they could lead to the expansion of dense urban areas to meet housing demands, potentially causing significant harm to the surrounding environment.

The alternative we need may require a more radical approach, rather than simply modifying existing cityscapes, to benefit both people and the environment. By reviewing the above register, we can set some new goals. Energy sources should have the least environmental impact possible, capitalizing on the unique strengths of each location. The way we build should focus on the needs of the commons, not the interests of corporations and lastly open spaces should be carefully considered, with the understanding that the natural surroundings of an urban area are still part of the environment.

### **Human derealization and liminal spaces**

The rapid urbanization of cities worldwide has led to overpopulated areas, isolating individuals in a constant state of derealization. That case makes for a state of the individual that could be characterized as liminality. Liminality is a concept that refers to a state of being ‘in between’ or on the threshold of two different states, stages, or places. Derived from the Latin word *limen*, meaning “threshold”, liminality describes a transitional phase where normal rules and structures may not apply, and ambiguity or uncertainty prevails. Liminal spaces are empty or abandoned places that often feel eerie, forlorn, and surreal. These spaces are commonly associated with transition, reflecting the concept of liminality.

The rapidly growing urban environment is used as a place of hosting a constantly moving working force with the sole purpose of an expanding Gross Domestic Product. The individual is in a constant state of productivity to ensure sufficient resources to keep surviving in the urban environment or to expand one’s wealth. The everyday schedule of every resident is to keep functioning accordingly, to keep the city’s way of life. Every misstep of this process creates a vicious cycle led by technological hedonism and market gain, leaving no place for socializing, inspiration or self-care. This unrelenting push for productivity, coupled with the overwhelming anonymity of urban life, isolates every aspect of the individual’s life. Over time, this contributes to a feeling of fragmentation, where individuals feel detached from their surroundings, their communities, and even themselves.

This decline in human experience is connected to the constant modification of the city that keeps evolving to meet the demands of the capital. The urban areas are undergoing a state of development that focuses on commercialization and use the cities as factories or products, rather than human settlements. The concept of the city as a product reflects on the way of life of every resident and defines their everyday lives. In this manner, residents feel that this way of life is the best and only option they have, leading to a deeper state of liminality.

While this phenomenon keeps expanding across the globe, the resource requirements are growing rapidly by the day. This leads to even more exploitation of the natural environment to keep up with these demands. Deforestation is a common practice to enlarge fields in order to increase the food and goods production, but also to place energy sources like wind turbines. Those modifications of the natural environment have a huge impact on biodiversity, natural formations and the individual characteristics of a place, gentrifying it and making it another alienated site.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

As cities continue to expand, the liminal experience becomes more pervasive. Urbanization that emphasizes on productivity and economic growth fosters a sense of isolation where individuals are caught between the need for survival and the absence of social existence, perpetuating emotional and psychological fragmentation.

### **Urban and non-urban revision thoughts**

The strategies proposed are informed by observations in the register, with the aim of sparking a discussion on the future of designing spaces for habitation. The first issue that appears common in both the statistics identifying the problems of modern habitation and the requirement for a sustainable city is the focus on density. While this is indeed a major concern, it must be addressed with caution to avoid undesirable outcomes. The main focus while creating an open-air city is reducing the built-up area and usage of the city center. This will set an example for the rest of the urban fabric. This proposal is a difficult and radical solution that may disorganize the cities for a certain time but will have a great long-lasting outcome. The changes in density should be made gradually and precisely, offering the people new common spaces to occupy and socialize. The infrastructure should be in favor of the residents and occupants of the city, providing them with proper affordable housing, means of transportation, that will also reduce the carbon footprint of the city and easy access to schools, public areas and workplaces. The reorganization of urban fabric should also focus on distributing land usage in a way that supports open spaces, provides communal areas, and facilitates production within the city, with usages like urban gardens. Finally, the city should move away from being a central hub and become more self-sufficient. Instead of depleting resources, it should prioritize better access to rural areas for more balanced resource distribution.

Another effective way to reduce the high density of cities while diversifying land use and production is deurbanization. A key factor for its success is strengthening rural areas and making them more appealing for habitation. A key focus should be the improvement of rural environments, making them more accessible and appealing for human habitation. An important aspect of this is addressing the needs of rural areas, such as access to water and affordable energy. A great number of the residents of those areas are living as farmers. Water and energy are vital for agricultural development and should be provided to strengthen those occupations. Agriculture can revitalize areas heavily injured by industry, making them a productive part of the environment. But this should not be the only concern when thinking about deurbanization. Rural areas should have diversified uses. Rather than distinguishing between city jobs and rural jobs, employment should be spread across all areas to encourage people to live throughout the region. Encouraging people to expand in a larger area, while diversifying the occupations for different trades can provide an equal habitational fabric that maximizes production while focusing on habitation and the individual's wellbeing. The final step is ensuring proper housing, public access to essential services like hospitals and schools, and establishing means of production that can support the community. The state should be able to provide common goods and services across the country and not only focus on the capital.

A key factor in this transition is alternative production. Currently, most land is controlled by corporations for private gain, rather than focusing on production for the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

commons. The means of production should prioritize the wellbeing of the residents of an area, rather than expanding in favor of capital. By decommercializing areas dedicated to mass production or depleted by the pollution caused by industries, the creation of spaces with the best living conditions can prove an effective way to face the problem of slums. Another important factor is distance. Local production reduces the need for transportation and eliminates the numerous stages involved in a product's journey. By diversifying the usage and production of an area can be a key factor in ensuring a more even distribution of the human population, with less environmental impact and fewer resource-draining centers. Local reserves can be vital for sustainability and the independence of areas, allowing for more even distribution of resources like water.

This type of production can be facilitated by semi-autonomous societies throughout the area. Local administrative societies tend to be more resourceful and have greater respect for the environment. Local administration can be crucial for the proper development of both urban and natural ecosystems. The people living in an area are more knowledgeable about certain strengths and weaknesses of those areas, that can help with the map problem. The main issue with maps and administration is that, in many cases, maps fail to account for elevation and generalize the use of large, diverse areas. By administering locally rather than on a large scale, it should be easier to manage most of the land area, instead of focusing on specific regions. Tending to the map problem can maximize certain strengths of an area that leads to more resourceful management. Resource distribution should also be a key priority, particularly in areas with limited access to natural resources or where farming and gardening are challenging. Additionally, local administration encourages people to care more about the places they live in, rather than those they don't. They once again connect with their natural surroundings, creating the best living conditions.

Finally, inhabiting spaces with a closer connection to nature can be beneficial for both the well-being of residents and the environment, helping to prevent the encroachment and destruction of natural land. Better communication and a closer connection with the natural environment should help prevent people from feeling alienated. The reintroduction of both people and cities to the natural environment should improve physical and mental health, reducing feelings of liminality. Common control of production should be crucial in stopping excessive production and the environmental destruction it causes. Finally, this could offer a new way to reevaluate habitation and the role of the city, helping people feel more connected and purposeful.

### **Possible outcomes and the future of cities**

A new approach to the city, or the urban environment in general, must be carefully considered. It should consider modern sustainability practices while also critiquing them. The theory posits that only a radical shift in how we inhabit our spaces can yield the desired results, and the steps to achieve this form the foundation of this theory. While this is indeed a radical approach, it is something that can be conquered gradually and with the least environmental and social impact. This type of urban healing idea and alternative ways of habitation can be loosely trace back to Doxiadis and the Ekistics. But rather than heading for the idea of the Ecumenopolis, this theory proposes that the best way to heal the problems of the modern cityscape is diversification of uses and autonomous collectives that respect the environment,

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

the residents and the culture of each region respectfully. The state of liminality is a modern theory that is the product of the time and should be addressed as such. By facing this problem, the closed city becomes evident.

In conclusion, the urban environment of the future must undergo a radical transformation to address the pressing challenges of climate change, resource depletion, and social inequality. Current solutions, such as the "Green City" concept, offer some promise but fall short by failing to address the root causes of urban issues, such as resource consumption, waste production, and the commercialization of public space. A more sustainable approach requires not just minor modifications to existing cityscapes but a fundamental shift in how we design, inhabit, and produce in our urban environments.

To move toward a better future of human settlements, we must prioritize a more decentralized model that promotes deurbanization, strengthens rural areas, and emphasizes local production and resource distribution. Cities should evolve from being resource-draining hubs to self-sufficient, eco-friendly communities that coexist harmoniously with the natural environment.

The desired outcome is a more refined and diversified urban environment that focuses on coexisting with the natural world, using its resources respectfully, and proposing a new way of designing cities in harmony with the environment. While there may be counterpoints to this essay, its aim is to spark a conversation about the future of cities during the climate crisis, with an emphasis on the well-being of every resident. This essay aims to emphasize the need for coexistence between urban and natural environments. It advocates for cities that are not parasitic, draining resources and producing pollution, but instead can coexist with and protect the natural world, while providing a better quality of life for all their residents.

## Abstract

The value of protecting natural spaces is highlighted by the environmental, social, economic and cultural principles of sustainability, which are recognized as contributing factors to the goal of development. Furthermore, the role of 'cultural routes' is very important, to strengthen the enabling environment by encouraging policies and methods that support sustainable tourism as a significant vehicle for managing cultural and natural heritage. It is well known that Greece, although a small piece of landmass with numerous islands scattered around, has always communicated with the rest of the world, the Mediterranean and beyond, through sea routes. Consequently, several of the most important cities that were established as ports were built next to the sea, from antiquity until today. The fact that Greece, at the edge of the Balkan peninsula, is surrounded by sea, reflects the importance of the water element as a means of communication and a pole of sustainable development for the coastal cities that constitute natural areas of great importance.

It is argued that the promotion of the identity of a “place” towards sustainable development undoubtedly has multiple benefits for the local society, in terms of improving the living environment and supporting cultural, social and economic development. Moreover, the progression of sustainable development goals in tourism, in a human-centered way, creates cultural and political connections between the local to global, the past to the present, transforming the modern traveller through experiences and co-presence into a ‘cultural traveller’.

This paper explores a contemporary approach to the promotion of “cultural landscapes” through the creation of Cultural Routes, at a “supra-local” level. The research focuses on a holistic view of methodological processes in terms of education and awareness for sustainable consumption and the improvement of the quality of life of citizens.

**Key words:** Cultural landscape, routes, political sustainability, interactive platform

## Introduction

In 1987, the concept of Cultural Routes was launched and established at European level by the Council of Europe with the aim to strengthen the common European identity through the contribution of a shared cultural legacy (EU 2016). Greece's contribution to the establishment

## PROCEEDINGS

---

of the partial agreement is highlighted by its role as one of the main pillars of cultural interconnection in Europe, as it has always been a crossroads of civilizations. Moreover, although it is a small country, it has the peculiarity that parts of its territory are mostly submerged in the sea. Thus, the landmass consists mainly of a main strip of land and a multitude of islands between the Aegean, the Ionian and the Cretan Sea, endowed with magnificent natural beauty with a wide variety of landscape variations. By extension, Greece has been a place intertwined with history and culture since ancient times, so every part of it includes archaeological sites as fragments of evidence of historical memory. Therefore, these two advantages (historical background and natural geographical location) can be exploited for cultural and tourist activities. Cultural Routes are emerging today as an important management and useful tool for the promotion of cultural resources and the advanced promotion of cultural tourism of a city, or of a cultural landscape. Through a marked path, the visitor has the opportunity to experience the history and culture of a place and to get to know its special physiognomy (Moraitis, 2015). But at present, the progression of sustainable development goals in tourism, at present are predominantly ‘local area’ focused, whilst ‘cultural landscapes’ are usually treated in a fragmented manner (e.g. archaeological sites from urban landscapes). Subsequently, a field of discussions and reflections on the management of this kind of cultural landscape has developed into an important field of research. This paper attempts to introduce a better understanding between the links of heritage and tourism. It also suggests that it is important for monuments and archeological sites not to be presented in isolation from their social context, but rather to be examined in relation to man and his environment.

### **A positive approach. Case Study: Research Area and general framework**

As a positive approach, it has been chosen a case study of a special innovative Cultural Route Project, created by the Ministry of Culture of Athens (Directorate of Prehistoric and Classical Antiquities) which is part of a broader action entitled "Cultural routes in emblematic archaeological sites and monuments", and included in the financial programs of the Recovery and Resilience Fund. The said action concerns the planning of a total of five (5) emblematic cultural routes, with themes that cover all periods of Greek history and extend geographically almost throughout the Greek territory.

The examined route implemented by the Directorate of Prehistoric and Classical Antiquities, whose implementation is still in progress, has the title: **"Cultural Route: The Road to the West. From Homer to Cervantes"**. The program unfolded in May 2022 and is coming to an end. (The supervisors have been appointed as: *Anastasia Gadoulou, Georgia Ivou and Napoleon Xifaras (archaeologists)* and the Scientific collaboration Team of: *Ieremias S. & Chiotis G. (archaeologists), Katraouzou D.-architect, Kotsainas M.-civil engineer*).

The main narrative of this Cultural Route deals with the 'dual movement of colonists': Greeks and Romans. An additional important element that differentiates this specific cultural route project from the usual ones is the different modes of transportation by the traveller-visitor, a fact that differentiates not only the character of the two individual routes (by sailing boat or by van land) but also the way of visitors' view and understanding. Specifically, the project consists of the next two sub-routes:

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The first one ‘from Greece to the West’ takes place as a ‘*sea route*’ (by a sailing boat). It refers to the historical background, where the Corinthians and the Achaeans, (from the 8th and the end of the 7th century BC) moved west, establishing colonies in Southern Italy and Sicily, following divine instructions from the Oracle of Delphi. The colonies that they founded were particularly important because they remained powerful cities for many centuries whilst in turn, they founded other new cities, thus creating *Magna Grecia*.

The second one ‘from the West to Greece’ is a ‘*land route*’ (by car, on foot etc.). It refers to the fact that Romans from the 1st century BC and after (167 BC) seem to have moved to the S.W. Peloponnese and specifically in Olympia for the games but also for the promotion of their emperors, while continuing to the Northwest they founded colonies, that is, cities with Roman citizens and corresponding rights, such as Patras and even Nicopolis, where Augustus consolidated his victory (after the conquest of Actium in 30 BC).

The physical object of this project concerns the creation of a ‘double cultural route’, which will connect various archaeological sites in the Peloponnese, central Greece, including the western Greece regions of the Ionian Islands and Epirus (Ephorates of Antiquities of Corinth, Achaia, Ilia, Phocis, Aitolokarnania, Preveza, Corfu and Ithaca). These sites, based on archaeological data and ancient sources, constitute starting points or stations in the movement of populations that transported goods and ideologies, within the general context of the economic, commercial and colonial process of early historical times, as well as of classical and late antiquity. Moreover, the distinctiveness of this tour is that it is based on the plot of an entire narrative, while it is formed with a network of physical and mental routes, articulating various types of ‘landscapes’. Thus, in addition to archaeological sites, such as cemeteries, sanctuaries, ancient cities and ports, it will include a wide range of information concerning architectural cultural heritage and natural environment ancient and modern. Furthermore, as well as elements of the intangible cultural heritage of the areas through which it passes will be addressed along the cultural activities of modern life such as: tours and visits to local festivities of music or food celebrations of local customs revival, and other artistic cultural events such as performances, exhibitions, sailing boat sports or navy competitions (e.g. Regatta etc.).

The following activities were scheduled to be carried out within the general framework of this project:

- to record and collate scientific documentation of selected locations, that will constitute main and secondary stops on the cultural routes, collection of cartographic data and audiovisual material, gathering information on monuments or archaeological sites located in close distance from the selected monuments on the route. This material will be fed to an *interactive digital platform*;
- to identify potential improvement works in order to beautify and enhance the surrounding area of the monuments/stations;
- to design, supply and organise the installation of information signs;
- to create the production of information material (guides/brochures) in various languages and in Braille, and to organise public information activities (e.g. seminar, periodic exhibition).

It should be noted that within the framework of the broader action of the Cultural Routes, for the implementation of the physical object of the above project, as well as for the indication

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

of possible locations and monuments, a range of improvement and promotion works are going to be carried out such as: cleaning, beautification, upgrade and/or expansion of existing paths, introducing interventions at both, ancient and modern paths for improved access and security. Moreover, conservation, restoration and promotion projects are proposed to be implemented by the competent regional services and central Directorates of the Ministry of Culture, as appropriate, in selected archaeological sites and monuments related to the above thematic routes.

Methodologically, an interdisciplinary collaboration has been followed for its accomplishment consisting of scientific documentation, natural and digital technologies correlated with material and intangible heritage data, myths and facts, symbolic and imaginative interpretations that intercross between the past, the present and the future.

### **Design of a cultural route. *The Architectural Project***

The aim of the work was also to demonstrate the contribution of these cultural places and landscapes to improving the quality of life, as well as the frequency and reasons for citizens finding them worth visiting (Aravantinos, 1997). On the other hand, the recent crisis caused by the pandemic of covid-19 has prompted an unprecedented acceleration of the digital transformation of the cultural sector in most countries (UNESCO 2020). According to this, the Hellenic Ministry of Culture also issued a special invitation for the creation and distribution of digital cultural material, original or converted from existing material, aiming at the possibility of remote access in the context of finding alternative ways of cultural production and innovative means of cultural expression (YPPOA 1995-2022). Additionally, the main goal is to create a dynamic relationship between individuals who may not share the same physical space but have an interest in the same topic. Thus, the creation of an interactive digital platform in our project aims to consist of a social and communicative ‘**common place=κοινό τόπο**’ using technology with the continuous flow of information and continuous feedback, investing in participation, safety and sustainability (Micheli, 2020).

All the members, of the Project’ working group, participated in the on-site inspections at archaeological stations along the route, where the areas that required immediate rescue interventions were recorded, drafting corresponding technical reports with intervention proposals and the relevant specifications. For the implementation of the project, we contributed to the creation of the interactive map of the route and digitized archival material, while in the context of planning its promotional actions, we collaborated with co-responsible bodies and representatives of local communities. Moreover, to create an exciting cultural route, the initiation on our project includes three stages that connect man with life and with other people over time: 1) Receiving information through digital browsing of the site, 2) in-situ browsing in real time with all the possible difficulties and physical fatigue but with the opportunity of experiential participation in actions and events (e.g. in sacred places to local festivals) and 3) providing feedback from knowledge and experience associatively as well as communicating and searching for participation in subsequent actions.

Specifically, due to the context of the ‘architectural work’ regarding the architectural design, the following were specifically implemented: According to a systematic bibliographic study of the findings of the Route Stations and based on the narrative of the Project, the ‘logo’

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

and the ‘informative metal signs’ of the Project were synthetically studied and digitally designed, while patterns were proposed for the creation of objects (souvenirs). As the goal is to encourage European citizens to rediscover their heritage, the ‘Architectural Synthesis’ of this project is characterized by: *Inspiration, Innovation, Exploration, Temptation for Socialization and Co-Presence*. In this way the experience should stretch throughout the entire time range, which means *before, during and after* the route. Overall, the architectural intervention concerned all stages from the idea conception to the design proposal in digital form of a complete series of architectural and construction drawings.

The design of the new information signs of the route, consists of a complete series of digital architectural and construction (detailed) plans of the basic, in totem type signs for indoor and outdoor use and two more alternative types for special cases. Specifically, their aesthetic aspect was studied and their graphic structure as well as their perspective and realistic form were designed in a color model, so as to fit into the wider landscape, proposing their placement positions at the thirty-three (33) stations in each case. Moreover, access configurations (for visitors and people with disabilities), signage, decorum and the promotion of monuments and archaeological sites were also proposed. Additionally, the design and beautification of the new main entrance area for the Heraion of Perachora at Corinthia, was studied. The architectural proposal concerns the construction of a ‘new central entrance’, of a new door with a new fence with an aesthetic upgrade of the surrounding area and the addition of a new visitor outdoor lounge with a canopy for visitors. The architectural design project includes the conception of the initial idea to digital design in a full series of architectural and construction plans as well as photorealistic presentations. For the implementation needs of the Project, market research was conducted into the type of products and construction materials. Due to the morphological aspect of every new construction of our route project concerning architectural or landscape ‘beautification’ design, the general rule focuses on the creation of a unified style, easily visible, with contemporary and innovative style. Functionally, it is necessary to have good quality of materials for resilience in outdoor exposure and to be easily informative and ergonomic for all categories of visitors.

### **Architectural Approach: The design of the route’s logo**

However, in order to encourage the development of a new type of tourism with an ethic focused on dialogue among cultures, the architectural investigation of designing the ‘Logo’ and the ‘Information Signs’ is to express the ‘meaning’ of the route according to its symbolic notion of the total narrative and the creation of a ‘new language’ with ‘new messages’.

Finally, the design of the project's logo was inspired by one of the dominant geometric motifs of ‘the spiral, founded in early historical times in ceramic art, in relation to the time period of the Geometric Age, in which our Cultural Route’ project refers to, but also to its symbolic dimension (Gadolou 2008). Considering that the Project of our Cultural Route “The Road to the West. From Homer to Cervantes” deals with the double movement of colonists: Greeks and Romans, the motif of the ‘double spiral’ that folds as a logo represents, precisely this double movement. Therefore, at first reading, the double folding form of the spiral of the logo in a symbolic and minimalistic way renders this two-way flow relationship of the movement of colonists ‘from Greece to the West and vice versa’ as well as the transfer of

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

their Cultural heritage. The term “colonization” in its conventional sense is used for the founding of cities because of the organized activity of a ‘mother city’ (metropolis/mother city) under the leadership of an official founder (oikistes/oikistes). Thus, the double movement of the spiral interprets this very relationship: from the mother city to the new city-offspring, expressing a centrifugal-extroverted force and a continuous introverted folding in reverse from the new city-offspring to the mother city. With a freer interpretation, the motto of the logo could also symbolize the ‘*Nostos for the return*’ or by extension the swirling wave of the sea for this journey. Odysseus, as a mythical figure of a traveller, hero and in a sense the ‘first colonizer’, inspired the myth (especially for Nostos) with his journey to return to Ithaca (Malkin, 1998).

Equally important, however, is that fiction inspires ventures, and so the Greeks, having a perception of reality and myth, succeeded and sailed, explored, created relationships of friendship and hospitality (xenia), raided, traded and colonized the coasts beyond Ithaca in the Ionian, Adriatic and Tyrrhenian seas, while simultaneously projecting the myth into new territories, thus articulating new landscapes, genealogies and ethnicities. As historical documents, the three-legged cauldrons (*tripods*) were also votive offerings of settlers to the West to propitiate the gods for a favorable outcome of their journey. Similar ones existed in sanctuaries such as Delphi, Olympia, the sanctuary in the cave of Loizos in Ithaca and elsewhere, an event directly related to the narrative of the work ‘from Homer to Cervantes’ (Gadolou, 2013).

In a second, more expanded reading, the double movement ‘Towards and From the West’, as rendered by the ‘folded spiral with a dot’, can also be likened to a wheel (of a chariot) that runs endlessly and arduously (on rough roads, throwing up gravel), traveling through the depths of time and history, marking the constantly recurring movement of people and goods around the world, but also the ‘global phenomenon’ of population migration, which with the corresponding mixing and exchange of different views and ways of life each time ultimately contributes to the ‘osmosis’ of ideas, people, types of art and cultures, thus contributing to the ‘overall,’ social, political and cultural ‘becoming’, enriching and developing it.

### **Architectural Approach: The Design of the Information Signs**

The project includes the design and placement of information signs at the stations along the route (e.g. archaeological sites and museums) that will inform the public about the narrative of the route to each station. The project's information signs were designed in a 'totem' type, while the logo and the vertically written title of the project (which are cut out) mark and emphasize them on both sides. Their construction consists mainly of two metal sheets: a larger one (dimensions 0.49m x 1.75m) at the back and a smaller one (by 10 cm) in front, which has a wavy shape to resemble the way a postcard unfolds, to facilitate the reading by a standing or a sitting person. They are designed to be used in both cases: for outdoor spaces, on a concrete base and for indoor use in Museums, as self-supporting (see Figure 1).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Due to the special nature of the Project, the design of the information signs has to satisfy various special cases such as: the different way and level of viewing (either from the sea or from land) so that they are easily recognizable even from afar, thus highlighting each station and its position as part of an overall Cultural Route. They can also be used as landmarks of significant intermediate stations, even in the case where the traveller does not need to go to them (e.g. their use to signify the position of important caves in the view of a traveller from the sea, sailing by boat, as they would have appeared in the eyes of a seafarer of the past) (Lynch, 1960). Specifically, the design of the information boards, according to their form and function, satisfies the following basic principles:

Morphologically, they are easily visible from sea & land (in a totem type) and are not similar nor competitive, with the existing ones found in museum and archaeological site signs -with a unified style, so as to mark on the one hand each station of the Cultural Route, as a ‘reference point’ and on the other hand its importance as a ‘part’ of a ‘wider overall tour’. They incorporate an innovative design (corrugated sheet metal that seems to unfold like a postcard) challenging the traveler-explorer to read it by additionally projecting the title and logo on both sides, while for their integration into the landscape, they are in rust-colored (‘Corten’ type).

Functionally, they are made of high-quality materials whilst manufactured to slowly wear and tear over time in outdoor exposure (e.g. severe weather). They are easy informative for all visitors (even at low level - for children and wheelchair users) and offer additional services for visually or hearing-impaired people (with Qr Code and audio listening method). Finally, they are ergonomic for all, due to their shape, proportions and the combination of vertical (covered with fine glass) and inclined reading surfaces, so that they can be read from close up and from distance.

*Figure 1: The project's information sign and logo, designed by Katraouzou Dimitra - PhD architect.*

### **Architectural approach: The design of the New Entrance and Sitting Area with Pavilion. Works to beautify and enhance the surrounding area of the Route.**

The important area of Heraion Perachora in Loutraki at Corinthia was chosen as the starting (departure) point of the maritime cultural route by sailing boat. The archaeological site takes its name to the great sanctuary of the goddess Hera Akraia that is located at the lowest point of the area, at sea level next to the old harbor (Payne, 1940).

The wider area uniquely combines the magnificent natural landscape of land and sea. The visitor who chooses to visit it by car arrives at the parking area, where the end of the road is. From that place to the top, where the archaeological site can be visited, the visitor has to walk down, along a pedestrian ramp, and pass through the existing ‘rough’ entrance. Thus, due to

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

the importance of sacred landscape and in the context of the possibility of beautification works, the design project for a new entrance was carried out. The basic architectural synthesis proposes the creation of a new central entrance with a new fence and the extension of a new sitting area next to it, with a pavilion.

Furthermore, in terms of beautifying and enhancing this important stop, the main goal of the landscape architectural synthesis, is to create an unbreakable contact in consecutive stages between the visitor and the archaeological site, even when the visitor is not inside it. Thus, according to the new architectural synthesis (see Figure 2), when the visitor arrives at the height of the platform, the form of the new entrance and the image of the new fence signifies ‘*the boundary*’ between the countryside and the archaeological site and the ‘*transition*’ practically and symbolically. Both the visual escapes from the walk and towards the archaeological site, as well as the urban planning of the new sitting area (with a clear reference to the ancient roads) intensify the visitor's communication with the archaeological site as well as with other people. Visitors are informed about the route by the project's information board (of new design), which is placed centrally in the open space, while small metal cubes arranged in a spiral direction create a fluid continuity and extend the sitting area.

Moreover, the compositional proposal was not limited just to a superficial beautification of the entrance but was deepened to reflect the interconnection of the sacred space with our cultural route, by searching for a new language about the common historical time period of the narrative with the relevant archaeological findings. Given the fact that the vessels are 'spoken symbols' telling the story of the people who used them (Gadolou 2013), this strong numerical repetition of lines and spiral forms underlines the conceptual correlation between the identity of society and its symbolic representations. Specifically, the design of the facade of the new entrance enclosure came out from the decoding of specific motifs and symbols of Achaean pots of the Geometric era, not by copying them, but by decomposition and redesigning in a new '*plexus*' (πλέξη), using also proportions regarding the '*golden ratio*'. Morphologically, the whole synthesis of the new entrance fence and its surrounding landscape distribution was treated as a sculpture.

Furthermore, its construction of rusty metal strips (analogous to those of the newly

*Figure 2. The archaeological site of Heraion at Perachora-Corinthia. The design of the New Main Entrance by Katraouzou Dimitra -PhD architect.*

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

designed information signs) harmoniously integrates the structure into the landscape even in the event of possible future damage from material fatigue, even in the case of lack of maintenance. The visitor, through a shaped pedestrian walkway-ramp, is directed to the archaeological site at a much lower level that ends up by the sea. After visiting the sacred site, the only way out is following the same ramp back to the (previous) area of the new main entrance.

The nearby addition of a newly designed shelter offers rest by also protecting in adverse weather conditions (like wind, rain or hot summer sunshine). Its characteristic cubic form creates a frame from where the visitor's gaze (like a photographic lens), focuses with contemplation on the unique landscape of the wider natural and mainly cultural environment.

Finally, the design of the facade of the new entrance as a ‘*striped barcode*’ of the architectural form works associatively to the visitor by transmitting the rhythmic pulse of the sacred space, even when he has left, while the knowledge acquired may continue to be fed back through the interactive platform. Upon leaving, the visitor should have experienced the place's code, felt the rhythm of history as well as the identity of the sacred cultural landscape.

## Conclusions

Memory has always been a contributing factor in the analytical and synthetic design process. From a local point of view, the open public spaces from ancient times until today are places of gathering and communication for citizens, an interface 'network' of exchange and expression of ideas, a 'political scene'. From a global point of view, according to Greek history, since ancient times, communication networks have been formed, both economically by the movement of goods through trade and culturally and socially by the exchange of ideas and social contact by the movement of people-travellers.

Nowadays, digital technologies and social networks have opened ‘new routes’ not only for information, searching and browsing, but also for communication by a multiple cultural interface.

This paper refers to the positive way in which the gifts of nature and history can be exploited to the maximum extent possible to constitute a natural, economic, historical and mainly tourist resource, that will familiarize citizens with both local and global cultural heritage, as well as strengthening the relationship between them. In particular, the modern cultural traveller has the opportunity to acquire valuable knowledge that is integrated into a broader game of browsing and gaining experiences of various cultural activities, combining creative exploration with education and entertainment, from antiquity to the present day.

The aim of the architectural research is also to demonstrate the contribution of these cultural sites and landscapes to improving the quality of life of citizens. By highlighting and redesigning them it is anticipated to make their integration into modern life more familiar and attractive so that citizens find them worth visiting.

Conclusively, the “identity” of Cultural Routes focuses on highlighting the physiognomy of the “diversity” of the urban and digital cultural landscape with the sense of “political viability” thus enabling the traveller to reproduce some kind of “collective end” - the model of “co-presence”.

---

Similarly, the initiated “world traveller”, following in the “footsteps” of the mythical traveller Odysseus, will discover that what is ultimately worthwhile is “the journey”.

**Moraitis Konstantinos**

*Professor Emeritus, National Technical University of Athens, School of Architecture*  
[mor@arsisarc.gr](mailto:mor@arsisarc.gr)

## Abstract

A web application for participatory urban landscape mapping was introduced in the educational process of the Schools of Civil Engineering and Architecture of NTUA. Using the application students were encouraged to document their perceptions of the landscapes in which they live. Student participations also included introductory lectures, independent-voluntary landscape evaluation by students, and feedback sessions together with educators. Participants created a dynamic and evolving landscape map merging spatial and qualitative data and participated in interviews and answered questionnaires to evaluate their participation.

The results investigated the application's impact in three distinct areas. Educationally, evaluating how its modernization of teacher-student interaction enhanced architectural education and helped students embrace architectural and landscape related education. Socially, by evaluating the effect of integrating interactive digital tools that allow democratic social participation in education and whether it managed to engage students in meaningful discussions and critical thinking about urban landscape quality. Scientifically, by yielding valuable data for analyzing architectural styles, urban typologies, and public perceptions thereof, supporting further research in the interfaces of the technology of crowdsourcing, Geographic Information Systems (GIS), mobile development, and studies in the area of culture and humanities. In the later stages of the research, preliminary insights and observations were also made on matters of expanding participant inclusion to citizens and to other European countries and its inferences for future research,

By bridging academia and society, the present research improved student's perception regarding architectural education, catalyzed scientific discussion on urban landscape quality, encouraged collective responsibility for improving public spaces and led to the observation of trends regarding the perception of architecture and landscape by the public. The presentation further summarizes the project's achievements, methodology, and implications for architectural education and research, in the context of urban landscape sustainability and its determinant natural and socio- cultural factors.

**Key words:** Landscape, Architecture, Education, Participatory, Democratic, Crowdsourcing, Mapping

#### Abstract

It is commonly accepted that in the contemporary city the ground and landscape in general is conceived as a thermostat. Just as the thermostat adjusts the temperature within a system by controlling the flow of heat in order to preserve the system's temperature, so the green or nature is seen as hedge against the negative environmental and aesthetical effects of the economic and cultural activities taking place within the contemporary city. The urban discontent is usually paused by enclaves of green natural pleasures.

Against that attitude and this thermostatic function, we present our project (under construction) for the transformation of the two central squares of the city of Trikala and the area in-between as a strategy of composing the public space and the urban landscape as a continuous flow not as an enclaved oasis.

That is to say, the paradox of a de-territorialized territory. The ambition of the project is to intervene and re-shape the landscape of the city center of Trikala not by finding an ideal analogy between natural/artificial. If anything, the plan tries to acknowledge the contradiction between natural and artificial as one single formal component, immanent to the city, that is, the landscape itself.

**Key words:** public space, contemporary city, landscape, Trikala

[evallianatou@outlook.com](mailto:evallianatou@outlook.com)

## **Abstract**

The proposed research aims to explore the ways in which Adult Education for Sustainability will be integrated into the contemporary Urban Landscape. The key question is, how an effective Formal Adult Educator Training, as well as a Non-Formal Adult Education, should be structured through organized educational programs, actions, communication policy and educational strategy to trigger a transformative way of thinking and acting, resulting in the creation of Sustainable Urban Communities and their Lifelong Action, in the urban landscape.

More specifically, in the field of Adult Education for Sustainability, the study is linked to the need to recognise the importance of the environmental and social limits within which human activity in cities needs to be confined. Regarding the second field of knowledge, the research will be focused on changing the current individual beliefs, habits and actions of citizens as units, towards a collective transformation of Lifelong Action, through organizing themselves into Sustainable Urban Communities.

The research will be conducted in the urban network of Athens as it alternates between characteristic nodes of the Attic Metro, in order to explore the needs of specific target populations and to pursue the desired outcomes.

**Key words:** Formal & Non-Formal Adult Education for Sustainability, Lifelong Action, Sustainable Urban Adult Education Communities.

## **Introduction**

Today, there's an enormous need for citizens to recognise the importance of the environmental and social limits within which human activity in cities must be contained. Science has already demonstrated the need to limit the temperature increase from human activity to 1.5o Celsius by 2030 in order to survive on Earth. To achieve it, the UN's agenda of 17 Sustainable Development Goals must be implemented in every corner of the world. But it is not easy to rationalize the truth to change the deep and unconscious consumption habits that drive human actions in today's globalized conditions. Nor is it easy to implement prohibitive measures, laws and policies that would restrict individual freedom through democratic processes when citizens themselves are not ready for such radical changes in their way of life (Orr, 2004).

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The general problematic of this proposal is the study, research and evaluation of adult education in both formal and non-formal contexts. Its character is interdisciplinary. It will move in the cognitive domain of two disciplines of adult education a) on sustainability and b) its lifelong action through the organization of sustainable urban communities. Particularly, in the field of adult education for sustainability, the study is linked to the need to recognize the importance of the environmental and social limits within which human activity in cities must be confined. In relation to the second area of knowledge, research will be concerned with changing the current individual beliefs, habits and actions of citizens as units towards a collective transformation of lifelong action through their organization into Sustainable Urban Communities.

### **Adult Education for Sustainability**

Izabel Rimanoczy (2021) proposes as a necessary precondition for this change the transformation of values, perceptions and beliefs towards a sustainable way of thinking and therefore acting for modern society, which will be achieved not only by taking into account the magnitude of the destruction the planet is experiencing, but by achieving 'a broad understanding of the revelations of the ecosystem, through social awareness and an intimate focus on personal values and the higher self, expressed through action for the common good. Such change is intimate and is reflected in several approaches that need to be developed at both individual and collective levels: ecological worldview, systems thinking, and emotional and spiritual intelligence.

The ecological worldview is a unifying perspective on reality that guides individuals in analyzing information and making decisions, taking into account aspects of environmental and social interconnectedness (Weber, 2010). This way of thinking might result in negative emotions such as fear, anxiety, despair, but also positive ones such as hope, enthusiasm, confidence, compassion. The ecological worldview is empowering and promotes awareness of the individual's role, as it activates the capacity to respond and the ability to choose behavior that has a positive impact (Barnes, 2013).

Cultivating relationships between people and places involves the notion that people are one and related to nature. Although today's citizens are not born into communities where such an understanding is a lived practice, there is a strong need for it. Without seeing it as a conscious process, redefining the relationship between humans and nature could mean seeing a connection to nature as embedded in it, and nature as embedded in humans. Rather than being emancipated and separated from nature, humans can reconnect with the city's natural environment (Horn & Hausdoerffer, 2017). As a way of connecting with it and reflecting on its wisdom, human actions could be relocated on guided tours in green open spaces, engaging with different senses, connecting with non-human beings and seeking inspiration from nature. Such exercises would provide an opportunity to stop, read and reflect on alternative ways of knowing that brings wisdom to their daily lives (Benyus, 1997). Human-nature values could get engaged with the idea and metaphor of connection with nature, through creative experimentation in which citizens could connect, get inspired and express their emotions on a personal level but also to get to know each other while connecting to the theme of human-nature relations.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The systems approach, on the other hand, helps to examine the interactions between different systems, their mutual influences and feedback loops, while feeding into the short- and long-term thinking that is equally necessary for sustainable decision-making (Capra & Luisi, 2014). As an alternative to polarization, the system's perspective focuses on non-binary thinking, leading to inclusive decisions that respect people and ecosystems, the present and the future. Moreover, systems processes encourage consideration of natural cycles, something societies today neglect, because they rely on linear thinking, with linear growth targets (e.g. GDP) that do not respond to the planet's finite resources and focus on control rather than adaptive resilience (Rowarth, 2018).

To cultivate this mindset, embodiment is a state in which new meanings, relationships, and understandings of self are developed through the connection of body, mind, heart, and imagination (Sipos et al, 2008). Embodied practices are practices that engage cognitive and embodied knowledge and nurture the body and mind in a simultaneous and synergistic way and in addition, create spaces of connection and expression beyond words. Participating in skill-building activities that are designed and curated around the idea that the body and mind are not separate entities, but an integrated and interconnected whole, can offer opportunities for deep connection with self, others and nature (Richmond & Snowber, 2019). For example, daily lessons could be encouraged, starting with an embodied knowledge session in a park, through movement exercises based on play or dance, or with workouts such as walking, stopping and running, and finally becoming aware of the space around oneself. Another embodied approach could be sensory walks, such as guided tours, which provide an opportunity to explore the specific area through the lens of a sense (e.g. auditory, visual, taste and smell). Playful learning also involves getting into a playful state of mind. Through play, people open up a way of breaking through cognitive biases and using other ways of knowing, acting and being.

The development of emotional intelligence is also challenging individuals to rethink the pace and speed of their behaviors, which tend to adapt to today's expectation of quick reactions, while decisions are made without adequate consideration of environmental and social impacts (Argyris & Schon, 1974; Goleman, 1995). Contemporary cultural values such as independence and autonomy, competition, comfort and wealth, while reinforcing individual identity, are an obstacle to sustainability. Finally, in order to develop a more sustainable mindset, individuals need to free themselves from limiting beliefs that prevent them from developing their full innovative and creative potential, which is of paramount importance in developing sustainable solutions (Nemeth & Oliver, 2017).

Getting to know the world in other ways, such as through imagination, creativity, intuition, sensations and emotions, is now a priority beyond the use of uninhibited scientific knowledge. Arts and science approaches are potential interdisciplinary methods for engaging and working with different habits of knowing in an open, collaborative and creative way. Art has the capacity to create learning spaces that help expand people's imagination for a regenerative, just and peaceful present and future. In these learning spaces, citizens can imagine and develop interventions and transform everyday situations. Such approaches provide a tangible experience and conceptual understanding of interdisciplinarity and how to explore broadening horizons for addressing environmental challenges. It could include a theoretical lecture on interdisciplinarity, as well as different interdisciplinary approaches to

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

imagining and co-creating just sustainable, healthy futures that promote a sense of belonging. (Kokkos, 2021).

In fostering emotional intelligence in societal change, stories can play an important role as they function like magnifying glasses that help us to make sense of and learn from a complex past and present (Grummell & Finnegan, 2022). A crucial aspect is their use of metaphors. Metaphors create meaning, images, emotions, values, and judgements about what is true and possible. Stories can become the windows into other worlds and lives, revealing hidden perspectives and illustrating the challenges others are currently facing while creating empathy and connection. They can illuminate future possibilities and thus support the creation of meaning, agency, and direction. As a way to reflect on understanding wisdom, storytelling sessions lead the group to get to know each other while connecting to the theme.

Finally, the spiritual intelligence approach aims at reunification with nature, a concept that is not acquired intellectually, but through actual experience. However, these are simple experiences, available to anyone at any time, without purpose, that bring a new perspective to peoples' thinking, influencing their choices and the way they relate to the natural resources on which they tend to depend (Zohar, 2012). Empathy, a term used to describe contemplative practices of all kinds, invites individuals to focus on the inner dimensions, the silent self, tuning out the noise and distractions and connecting with their intuitive and ancestral wisdom. As individuals, human beings move from automatic and reactive behaviors to more conscious, purposeful and directed ones, they give new meaning to their self-realization and bring out the best of what they have for the sustainability of the planet (Scharmer, 2009).

Exploring and connecting to one's inner capacities and most important values is a powerful and effective way of building empowerment and leadership. Creating spaces where citizens can explore the values that underpin their actions and where they can deepen their sense of meaning, can be highly empowering and can strengthen their commitment to regenerative urban futures. Across different cultures and geographical contexts people value the relationships that ensure cooperation and protection of the natural world and that it is a matter of making these values salient and bringing them into practice. Discovering and cultivating the values that inform and motivate people can help establish ethical, responsible, and caring relationships within and beyond their neighborhood. Working in small groups on personal moments of deep insight and intuition that changed their course of action in the past, or sharing experiences when they felt that their purpose was aligned with their actions could help identify useful tools and practices to invite wisdom into daily decisions.

### **Urban Sustainable Communities and the Circle of Lifelong Action for Sustainability**

The Urban Sustainable Community could be developed as a space for expression and action, through collective change and individual approaches, to achieve a sustainable way of thinking and acting locally. Recent research has shown that there is widespread public support for bolder action to protect the planet, despite prevailing perceptions that citizens are less likely to act, or that the burden of action falls disproportionately on the less well-off, discouraging their participation. Changing the narrative to one of widespread public support, and telling stories of communities that have taken action, is more likely to inspire citizens to take concrete action to reduce inequalities and build social trust, thereby promoting widespread public

---

support for urgent and bolder action for the planet that supports the well-being of all (Chamberlin, 2009).

Building lasting alliances through the creation of local sustainable urban communities requires patient work to build common understanding, trust and partnerships. New ways of thinking and acting often require explaining the same thing over and over again. On the tactical side, it requires a deeper understanding of who the key people are, who can influence political processes and who can often be barriers to progress. It is important that adult educators engage using a variety of approaches and tools, as mentioned above. Working with local actors and civil servants to support lifelong learning requires the integration of systems thinking into public administration and policy making so that they are better equipped to address interrelated societal challenges. Policies should not be something that governments impose on citizens and that only politicians talk about. There should be more support and education for every citizen to participate actively in policy making (Vandenabeele, Schreiber-Barsch, Finnegan 2024). Therefore, it is the education of citizens in a culture of lifelong action that will gradually lead them to active participation and active citizenship.

The research will attempt to apply the idea of a cycle that promotes the regeneration of lifelong action in the urban environment. This cycle aims to be renewed and revitalized by the citizens themselves, who, by changing roles throughout the process, actively participate in the transformation, both individually and of the city. In the first step of the cycle, the neighbors of a place commit themselves to how they will create the community forest, a reference point in which they will cultivate their individual and collective consciousness. Its creation is intended to encourage further experimentation in the neighborhood to implement sustainable solutions. The second step involves cultivating connections with the natural environment at an individual level, bringing the local population together through reflection and finding meaning in the daily life of the community. In the third step, non-formal lifelong learning, which promotes critical reflection and dialogue, is used to transform established beliefs and strengthen collective sustainable thinking. The fourth step for the neighborhood is a commitment to collective action by transferring the knowledge gained to the next neighborhood, ensuring continuity of lifelong action for sustainability across the city.

### Working case - Objectives

Individual research objectives will be set:

- In the first phase, to study and review the current international literature and research on Adult Education for Sustainability in the Urban Landscape as it has been reflected in contemporary societies.
- To study the current situation in Greece regarding the existence of organized actions, activities, educational programs concerning Adult Education for Sustainability in the Urban Landscape and to present the typology of these programs and activities.
- To draw conclusions about the needs and expectations of adults to ensure a sustainable future in the Greek urban landscape.
- To identify the obstacles that constitute a barrier to the adult learning process, both towards an individual sustainable transformation and towards a collective lifelong action transformation, and to propose ways to remove these obstacles.
- The study and presentation of contemporary educational theories of adult education (with particular emphasis on transformative learning, critical reflection) and their potential for creative application in adult education for sustainability in the Greek urban landscape.
- In relation to the previous objective, to propose appropriate pedagogical techniques and tools to facilitate learning.
- The study of case studies and good practices in the organization, implementation and application of formal and non-formal education programs for Adult Education for Sustainability and Lifelong Action in urban landscapes worldwide.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- The potential contribution and use of digital technologies, modern and asynchronous tele-education in the effort to broaden the way citizens organize themselves in sustainable urban communities.
- The presentation of the necessary and specialized knowledge and skills that Adult Educators for Sustainability and Lifelong Action need to possess in order to be able to fulfil their task.

In particular, the role of training adult educators in the creation of sustainable urban communities and their lifelong action in the urban landscape will be explored:

- In formal training and certification of adult educators for urban sustainability and lifelong action.
- In non-formal education, focusing on the organization and implementation of face-to-face and online training programs on the creation of sustainable urban communities and their lifelong action, through research-action.
- In informal learning, through actions within the urban fabric that contribute to collective Lifelong Action for the city.

### Research methodology

The research aims to change the current individual beliefs, habits and actions of citizens to search for internal contradictions and gaps in a system of thought (or discourse) and push these contradictions to the point where something different emerges, so that they can begin to see where possibilities for change might lie and where they might take action (Kearins & Springett, 2003). To construct qualitative research 'with people' rather than 'for people' requires theoretical and methodological creativity. The focus cannot therefore be on data collection, but on stimulating and encouraging collective and critical knowledge production with participants. Collaborative action research requires different ways of approaching it, through criteria of validity, reliability, ethics and quality, based on the researcher's ability to truly respond to what is learned through dialogue. Aiming to explore the ways in which Adult Education for Sustainability is integrated into the contemporary urban landscape, the research will be conducted in the urban network of Athens as it alternates between characteristic nodes of the Attic Metro, in order to explore the needs of specific target populations and to pursue the desired outcomes.

### Research Tools

#### 1<sup>st</sup> Stage: Creating Community Forests at Metro Stations

Areas of trees, called "community forests", will be created at indicative metro stations. Inside, passengers will be able to walk around the space, creating sensory connections with the natural environment that is missing in their area. Using QR codes located along the route, passengers will be able to enter links on their smartphones, either through story examples or through exploratory questionnaires, to indicate their willingness to regenerate and green their neighborhood, as well as the place where they would like to be active.

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

### 2<sup>nd</sup> Stage: Empowering Urban Communities for Sustainable Regeneration

From the 1st stage, samples of the population will be taken in different locations to form the first groups of adult learners. They are the ones who, in the second phase, will actively participate in a non-formal training course on the role of sustainability in the daily life of the city and the results that can be achieved through collective action.

The main objective is to increase the positive and active participation of citizens in creating a sustainable future in their local community, based on the shared values they will co-create (Suzuki, 2007).

The training will be followed by second action-research of the groups in their respective neighborhoods. The trainees will be asked to carry out a sustainability action through awareness-raising and action by local collectives, first at the level of the apartment building and then at the level of the neighborhood. From the groups formed, conclusions will be drawn, adapted to local needs, and problem-solving efforts will be carried out, with the aim of transforming the habits that lead to unsustainable practices in the daily lives of citizens.

### 3<sup>rd</sup> Stage: Creating Community Forests - Fostering Sustainable Urban Engagement

In a third stage, the "sustainable urban communities" that will emerge through collective processes will claim the creation of their Community Forest, a reference point in the neighborhood for the further development of a sustainable culture that will have a multiplier effect on the wider area. The Community Forest will be studied as a research tool within which to carry out processes of connecting the different populations that make up the urban landscape and interacting with local actors, forming the basis for direct participation in the management of public space. The main objective is to enhance the positive and active participation of citizens in the creation of a sustainable future in their local community, based on the shared values they will co-construct.

The non-formal educational material will help the citizens of the communities to address social cohesion AND environmental challenges; to carry out projects and implement their inclusive democratic participation; to support teachers in new key competences so that a new curriculum can be created from all the research and intercultural knowledge can be co-constructed. At the end of the three phases of research, pedagogical material will be collected to formulate formal training of sustainability educators to become key relays in the non-formal training of local cooperating teachers in the field of social sciences/citizenship.

### **Desirable outcomes**

The success of the whole project would be considered as its continuing character through a cyclical renewal of adult education for sustainability and especially of Citizens' Lifelong Action in the urban landscape. The research will attempt to theorize this desirable circularity through **the circle of lifelong action for sustainability**.

In conclusion, there is urgent need for formal training of adult educators for sustainability to be built up. They will be the leaders for a Non-Formal Education of the citizens through organized educational programs and actions, building a communication policy and educational strategy that will trigger a transformative way of thinking and acting and finally, resulting in the creation of Sustainable Urban Communities and their Lifelong Action, in the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

urban landscape. In order to carry out the research, key stakeholders must be contacted, and resources have to be raised, in order to implement the project in the most efficient way. The expected results may be able to provide the impetus to overcome the current difficulties in adopting sustainable practices in the city.

### **URBAN PLANNING IN A PROCESS RE- CONSIDERATION AND RE-EXAMINATION.A CASE STUDY THE MUNICIPALITY OF LARISSA, THESSALY, GREECE.**

**Markatou Maria**

*Municipality of Larissa, Directorate of Urban Planning/ Ph.D NTUA,National Technical University of Athens, Greece*

[markatou@uth.gr](mailto:markatou@uth.gr)

#### **Abstract**

Urban planning is a technical and political process concerned with the use of land and design of the urban environment, including air, water, and the infrastructure passing into and out of urban areas such as transportation and distribution networks. In theory, urban planning is a process of elaborating solutions that aim both to improve or re-qualify an existing urban area, as well as to create a new urbanization in a given region. As a discipline and as a method of action, urban planning deals with the processes of production, structuring and appropriation of urban space. In this sense, its main objective is to point out what measures should be taken to improve the quality of life of the inhabitants, including matters such as transport, security, access opportunities and even interaction with the natural environment.

However, nowadays, urban planning has to deal, interact and include issues and elaborate solutions derived from other categories of planning, such as those of civil protection, climate change, accessibility and investment plans, etc.. This is a great challenge of urban planning as well as the citizens of every city involved in. Larissa realized the above “great challenge” in September 2023 when the phenomenon Daniel took place. Nowadays, the city is in the process of reconsidering its urban planning taking into consideration the different issues raised by both climate change as well as sustainability, which includes cultural, economic, environmental, political and social parameters. In this context, the paper deals with the case of Larissa in relation to the above considerations and presents areas of co-existence, complementarity and conflict among different categories of planning.

#### **Abstract**

Urban sustainability is “an adaptive process of facilitating and maintaining a virtual cycle between ecosystem services and human well-being through concerted ecological, economic, and social actions in response to changes within and beyond the urban landscape”. Urban structures are complex systems, bringing communities and the environment in a living, continuously evolving setting. They are social, cultural and economic centres, embedded in the regions surrounding them. Despite these commonalities, each city and town in Europe is unique. They have unique features developed through history, shaped by their geography, inhabitants and socio-political systems. Consequently, the challenges faced by cities vary significantly. Some cities face ageing or shrinking populations, whereas others are growing.

Most urban structures have been inhabited over centuries and their streets, neighbourhoods and buildings reflect this heritage. The existing infrastructure partly determines how fast we can replace the building stock or retrofit the existing buildings or create new transport options. Achieving sustainability in these cases requires careful considerations. The goal towards urban sustainability and its impact on landscape needs to cater to each city’s unique set of characteristics as well as challenges, as well as issues of circularity, resilience and inclusivity. In addition, parameters of a low-carbon, green and healthy city should be also incorporated.

In this context, the paper discusses the goal of developing a sustainable urban landscape for the city of Larissa, the 5<sup>th</sup> largest Greek city elaborating ideas and highlighting factors of natural and socio- cultural content that will contribute to the above goal. As a final result a conceptual framework will be created which will help the city re-plan and re-design.

### **Special session: COST ACTION 22124 ECO4ALL**

## **ECO4ALL FOR CONSUMER PROTECTION THROUGH CIRCULAR ECONOMY STRATEGIES – THE CONTRIBUTION TO SUSTAINABLE DEVELOPMENT**

Carrying out sustainable development goals by 2030, especially focusing on sustainable consumption, represents a collective priority in today’s society, but significant regional differences within the EU and globally. In this context, the transition to the circular economy (CE) brings a significant paradigm shift in modern sustainability strategies, especially in the area of consumer protection and the development of sustainable practices. ECO4ALL action responds to these challenges by encouraging regional and international cooperation to improve sustainable consumption and consumer protection, thereby contributing to the achievement of sustainable development goals and creating a circular economy that serves the interests of all participants in society. ECO4ALL particularly emphasizes producer responsibility in the product design and marketing stages, thereby encouraging consumer protection through the strategies of reducing, reusing, and repairing products.

The special session will focus on circular economy (CE) strategies that can improve consumer protection, reduce environmental risks, promote resource efficiency, and alleviate inefficient use. One of the key aspects of this session will be a discussion on how the proactive role of consumers can contribute to the full circularity of the process, through inclusive participation in every step of sustainable development, and advocating for stronger regulatory frameworks that encourage circular practices. ECO4ALL thereby complements existing EU policies, which are focused on the ecological and productive aspects of the circular economy, expanding the focus on social and consumer dimensions.

The key topics of the present Session are the following:

- The Role of Circular Economy in Achieving the 2030 Sustainable Development Goals
- Circular Economy Strategies for Sustainable Resource Management
- Consumer Protection through Product Lifecycle Extension through Reducing, Reusing, and Repairing
- Circular Economy as a Tool for Sustainable Consumption
- Enhancing Cross-border Cooperation for Circular Economy Success
- Policy Frameworks for Regional Development and Their Impact on Circular Economy Adoption
- The Socio-Economic Impacts of Circular Economy Practices on Consumer Rights
- Overcoming Barriers to Circular Economy Implementation in Different Regions
- Cross-sector Collaboration for Promoting Circular Economy in Consumer Markets
- Education and Awareness for Sustainable Consumption

#### **Abstract**

In contemporary society, the idea of a circular economy plays a crucial role in achieving sustainable development goals. It promotes efficient resource use, enabling reuse and recycling instead of single-use. It is based on economic systems and business models that replace the linear model with alternative approaches such as reducing, reusing, and repairing. As consumer needs become more complex and technologies advance, it is necessary to focus on circular strategies that enable responsible resource management and strengthen consumer awareness. This paper aims to identify barriers to implementing circular strategies by analyzing consumer education and the relationship between systems, needs, and opportunities, focusing on the local specificities of the countries involved in the COST Eco4All action. The research includes data from 30 countries collected through surveys. The results will be processed through statistical analyses to identify differences in barriers and opportunities between these countries, providing insights for creating more effective circular strategies at regional and national levels. The paper highlights the importance of consumers as catalysts for circular transformation, whose protection and engagement have a fundamental impact on the success of this concept.

### Introduction

In today's world, the circular economy (CE) is recognized as a fundamental concept. Increasing concerns over rising resource consumption have prompted both governments and companies to adopt circular models. These models not only help alleviate resource scarcity but also serve as a source of innovation and economic development (Alves et al., 2022). This concept has gained global significance as it addresses the issues of diminishing resources and the environmental challenges posed by the current linear economic model. It also encourages active consumer protection and education (WHO, 2018).

Therefore, to promote sustainability and effective resource management, the circular economy has emerged as an innovative approach that links industries, governments, and consumers (Brydges, 2021). It provides solutions for more efficient material use and recycling within industries while promoting policies encouraging sustainable economic growth at the government level (Alves et al., 2022). Additionally, it empowers consumers to adopt more responsible habits, engage in product reuse, and support circular business models (Jain et al., 2018; Geiger, 2018).

This concept encompasses various aspects, including adapting business models, redesigning products, and promoting responsible resource use. Of particular importance is the involvement of consumers in this process by raising awareness of the importance of circular models, educating them about sustainable practices such as recycling and reuse, and providing information about consumer rights in the context of the circular economy (Stumpf et al., 2021).

The circular economy provides numerous benefits but presents some challenges for consumers. This model operates on principles of "make-use-return" or "take-make-use" with the goal of reducing waste production. As a result, it has distinct implications for consumers (Schaik, & Klundert, 2001; Elisha, 2020). In this context, consumer protection involves ensuring that products are safe, durable, and designed for repair or reuse. To successfully implement this concept, companies need to undergo structural changes while also fostering informed consumers who comprehend the principles of circular business. This approach ultimately contributes to sustainable development as a whole (Lewandowski, 2016).

The concept of a circular economy has been extensively studied, particularly regarding general sustainable development and waste reduction strategies. However, significant research gaps exist in understanding the specific aspects of its implementation at the international level, especially when considering countries' local specificities. Most existing research focuses on macroeconomic policies, technological innovations, and industrial models, while there is relatively little emphasis on the interaction between consumer education and their specific needs. Further analysis is needed to understand how education and environmental awareness can overcome barriers to implementing a circular economy and adapt circular strategies to various socio-economic and cultural contexts. In this sense, this paper seeks to fill existing gaps through the analysis of three key research questions:

**RQ1:** How does work experience influence the perception of personnel, organizational, and financial barriers in managing a circular value chain?

**RQ2:** How does work experience influence the perception of institutional and infrastructural barriers to implementing the circular economy?

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

**RQ3:** How does the country of origin influence the perception of institutional barriers, such as the absence or low level of financial incentives and the effectiveness of recycling laws?

Hence, this research aims to examine how strategic planning and management can contribute to a more efficient application of circular economy principles, emphasizing overcoming key barriers, such as personnel, organizational and financial obstacles, and institutional, infrastructural, and legal challenges. The research will also analyze how these barriers affect the strengthening of environmental awareness and active engagement of consumers, as well as the challenges associated with implementing circular strategies that must be adapted to local socio-economic and cultural specificities in the countries involved in the COST action Eco4All.

### Literature review

The circular economy is an alternative to the traditional linear economy, which relies on the "take-use-throw" model by promoting a pattern of reducing, reusing, and repairing (Özkan et al., 2020). In a circular economy, resources are kept in use for as long as possible to maximize their value. Once products and materials have served their purpose, they are returned and reused instead of being discarded (Morgan & Mitchell, 2015). According to Erkman (2001), when a product reaches the end of its life cycle, its materials tend to be retained within the economic system wherever feasible. In this way, materials can be reused, thereby continuously creating additional value.

The circular economy, as a sustainable approach, aims to reduce the negative effects of the linear economy by building long-term resilience in business and economic circumstances while providing significant environmental and social benefits (Alves et al., 2022). This model is gaining importance in developing countries and developed economies, supporting various sectors such as industry, tourism, and services. The focus is on reducing waste at all stages of the production process, from design to disposal, which not only improves sustainability but also contributes to closing the supply chain loop (Hartley et al., 2020).

According to Bocken et al. (2016), strategies play a key role in implementing circular approaches, enabling organizations to extend the life of products, reduce waste, and use resources efficiently. Well-designed strategies promote economic and environmental benefits and raise awareness of circular practices through the engagement of consumers and other relevant stakeholders. Hence, strategic management in the circular economy is a key factor for achieving sustainability and encouraging consumers' active participation.

Innovative models, driven by digital technologies, rely on close cooperation with customers, mass personalization, and sharing and collaborative economy principles. They accelerate the transition to a circular economy and encourage resource optimization, making the European economy less dependent on primary raw materials (European Commission, 2020).

The European Commission (2020) proposes changes to the law on consumer protection in the EU to encourage greater consumer participation in the circular economy. These changes aim to provide consumers at the point of sale with reliable and relevant information about products, including their lifespan, as well as the availability of repair services, spare parts, and

---

repair manuals. Also, companies and consumers can jointly analyze the end of product life, focusing on recycling, repairing, and reusing options (Islam et al., 2021).

Consumer behaviour plays a significant role in the success of companies that apply circular principles in their business (Parajuly et al., 2020). According to Islam et al. (2021), consumer behaviour research can help companies find appropriate methods to improve aspects of the circular economy that will serve consumers through their consumption and raise awareness about disposal, recycling, and repair. Active participation of end consumers is a key factor in the transition to a circular economy, as it influences the demand for products that support this model. This includes durable, high-quality, and repairable products, as well as those that can be reused, recycled, remanufactured, repaired, or resold, and products that can be shared (Shevchenko et al., 2023).

### Methodology

This paper presents the results of a survey conducted within the COST Action CA22124 - ECO4ALL framework, in which representatives from 30 countries participated. A total of 165 respondents were surveyed, which provides a significant basis for analysis. The survey aimed to collect data on the role of consumers in circular practices, with a particular focus on activities such as waste reduction, reuse, and product repair. Conducted through a structured online questionnaire, the survey highlighted the importance of empowering consumers by informing them about their rights, obligations, and opportunities in the context of a circular economy. In addition, their impact on creating business policies and strategies was analyzed. The data obtained serve as a basis for quantitative analysis and formulating recommendations for improving public policies at the national and European levels.

Before proceeding to a detailed demographic analysis of the respondents, the measuring instrument's reliability was checked. The calculated value of Cronbach's  $\alpha$  coefficient for the entire data set was 0.978, indicating an extremely high level of reliability of the instrument. These results confirm that the measuring instrument is adequate for assessing the selected parameters and provides justification for continuing the research with a more detailed analysis of the data. This provided a stable basis for interpreting demographics and other relevant aspects, further contributing to the conclusions' relevance and significance.

### Data Analysis and Results

After data collection and initial analysis were completed, incomplete responses were eliminated from the sample, resulting in a final set of 165 valid questionnaires. Table 1 shows the demographic characteristics of the respondents.

**Table 1: Demographics profile of respondents**

| Measure       | Item    | %    |
|---------------|---------|------|
| <b>Gender</b> | Male    | 34.5 |
|               | Female  | 65.5 |
| <b>Age</b>    | 18 - 30 | 25.5 |
|               | 31 - 40 | 24.8 |
|               | 41 - 50 | 30.3 |

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

|  |                |      |
|--|----------------|------|
|  | Turkey         | 17.0 |
|  | United Kingdom | 1.8  |

Table 1 shows the demographic profile of the respondents, including gender, age, education level, work experience, and countries of origin. Most respondents are women (65.5%), while men comprise 34.5%. The age groups are diverse, with the most represented respondents aged 41 to 50 (30.3%), followed by those between 18 and 30 (25.5%) and 31 to 40 (24.8%). The age group from 51 to 60 is less represented (14.5%), while respondents over 60 are rare (4.8%).

In terms of education, the majority of respondents have a doctorate (60.6%), while a smaller percentage have a master's degree (16.4%), basic academic studies (9.1%), college (7.9%) or high school or lower education (6.1%). Work experience varies, with the largest number of respondents reporting between 11 and 20 years of experience (30.3%), while groups with less than five years (21.2%) and over 30 years (14.5%) are less represented.

Respondents come from 30 different countries involved in the COST action. The most represented participants are from Turkey (17.0%), the Republic of Moldova (16.4%), Serbia (12.7%) and the Czech Republic (9.7%). A smaller percentage comes from other countries, such as Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Greece, Hungary, Italy, Portugal and Spain, with less than 8% shares. This diversity, which includes participants from a broader pan-European context, provides a solid basis for analysis within the framework of international cooperation and research within the ECO4ALL action.

Further data analysis examined the relationship between demographic characteristics, such as work experience and country of origin, and barriers that limit circularly responsible consumer behavior. This approach allowed for a deeper understanding of the interrelationships between these variables, providing a basis for formulating conclusions and identifying factors that influence consumer behavior in the circular economy context.

### Discussion of the results

This research analyzes the relationship between demographic characteristics, such as work experience and country of origin, and key barriers that hinder effective circular value chain management. These barriers include personnel, organizational, and financial obstacles, as well as institutional, infrastructural, and legal challenges that can hinder the implementation of circular practices.

The relationship between customers' work experience and perceptions of personnel, organizational, and financial barriers was examined: high initial investment (Barr\_hii) and short-term interests of stakeholders (Barr\_stis). The research question RQ1 was confirmed based on the obtained results. The results show significant differences in responses depending on the length of work experience. For the high initial investment barrier, participants with work experience of 1 to 5 years and 11 to 20 years more often perceive this barrier as extreme. For the short-term interests' barrier, participants with work experience of 11 to 20 years express the most concern. Statistically significant results ( $p = 0.024$  for Barr\_hii and  $p = 0.000$  for Barr\_stis) indicate that work experience influences the perception of these barriers, which are classified as personnel, organizational, and financial barriers, with those with more work experience more often recognizing these challenges as significant obstacles.

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

Within institutional and infrastructural barriers, statistically significant differences in responses related to consumers' work experience were observed for four key items. The first item, Absence or low level of financial incentives (IIB\_fi), showed a significant difference in responses, with consumers with more work experience more often perceiving this barrier as significant ( $p = 0.001$ ). The second item, Antitrust laws that prevent cooperation in the circular economy (IIB\_al), also showed a statistically significant difference ( $p = 0.038$ ), with consumers with 11 to 20 years of work experience expressing agreement with this barrier more often. The third item, Problems with responsibility, obligations and ownership of the circular economy implementation process (IIB\_roo), also showed a significant difference ( $p = 0.015$ ), with the highest percentage of responses as a significant barrier being given by consumers with work experience between 11 and 20 years. Finally, Limited reverse logistics capacities (IIB\_lc) showed the highest statistical significance ( $p = 0.000$ ), indicating that consumers with more work experience often see this barrier as an important challenge in implementing the circular economy. These differences show that work experience plays a significant role in the perception of various institutional and infrastructural barriers in the process of transition to a circular economy. Based on these findings, the research question RQ2 is confirmed. The results demonstrate that work experience significantly influences the perception of institutional and infrastructural barriers, as evidenced by statistically significant differences in responses for key items such as financial incentives, antitrust laws, responsibilities in the circular economy process, and reverse logistics capacities.

When it comes to analyzing the relationship between countries of origin and barriers within institutional and infrastructural barriers, two items showed a statistically significant difference: Absence or low level of financial incentives (IIB\_fi) and Recycling laws are ineffective in achieving (IIB\_r) high-quality recycling. According to the results of the Chi-Square test, IIB\_fi showed a statistically significant difference (Pearson Chi-Square = 154.141,  $df = 116$ ,  $p = 0.010$ ), with countries such as Serbia, Albania and Turkey marking this item as an "Extreme barrier" more, while other countries, such as Hungary and Portugal, had a lower number of such responses. Similarly, for IIB\_r (Pearson Chi-Square = 151.711,  $df = 116$ ,  $p = 0.015$ ), countries such as Turkey and the Republic of Moldova also perceived recycling laws as a significant barrier. In contrast, other countries, such as Slovakia and Portugal, were less concerned about these laws' effectiveness. These differences point to the different attitudes and challenges that countries face about recycling financing initiatives and legislation. Based on these claims and statistically significant differences, the research question RQ3 is confirmed, indicating that countries of origin significantly influence the perception of institutional and infrastructural barriers.

## Conclusion

The transition from a linear to a circular economy model is a continuous process that changes traditional production and consumption paradigms. This research examines how strategic planning and management can contribute to a more successful implementation of the circular economy principles by overcoming key barriers, including human resources, organizational, financial, institutional, infrastructural, and legal challenges. In addition, the analysis focuses on the impact of these barriers on increasing environmental awareness and active consumer involvement, with a particular emphasis on adapting circular strategies to the specificities of

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

the countries covered by this research, which are involved in the COST action ECO4All. Given the importance of consumers in this transition, their behavior is recognized as a key factor in achieving sustainable change.

This research contributes significantly to understanding how work experience and country of origin influence the perception of key barriers to implementing a circular economy. The results highlight that work experience shapes consumer attitudes towards barriers such as high initial investments and short-term stakeholder interests, while institutional and infrastructural barriers, such as lack of financial incentives and limited reverse logistics capacities, further complicate the transition process. In addition, significant differences between countries indicate the need for a localized approach that considers specific socio-economic and cultural characteristics.

This paper's theoretical contribution lies in filling the gaps in the literature on consumer interaction with circular economy principles. The research expands the existing understanding of barriers with a focus on their perception from the consumer's perspective, which contributes to the development of more effective strategies for education and awareness raising. Analyzing work experience and origin as key determinants enables more precise modeling of obstacles and solutions in the circular economy.

The practical implications are manifold. For companies and policymakers, the findings suggest adapting strategies and communication campaigns to overcome the barriers perceived as key by different consumer groups. Educating consumers about the principles of the circular economy and providing financial incentives can significantly improve their involvement and acceptance of this model. Also, the identification of differences between countries provides a basis for developing localized policies that respond to the specific challenges of each country, thereby contributing to the global goal of sustainable development.

### NORDIC CROSS-BORDER COOPERATION FOR CIRCULAR ECONOMY SUCCESS

**Goncharuk Anatoliy**

*NLA University College, Kristiansand, Norway*

[agg@ua.fm](mailto:agg@ua.fm)

#### **Abstract**

The Nordic countries, namely Norway, Sweden, Denmark, Finland and Iceland, are at the forefront of cross-border cooperation to promote the circular economy. Their joint approach uses shared values, regional networks and policy alignment to achieve sustainable development goals and promote circular practices. This paper has examined the following key aspects of this cooperation, namely: policy coordination and frameworks; knowledge exchange and research collaboration; industry and business integration; infrastructure and waste management; consumer engagement and education; and global leadership. On the one hand, the main achievements of this cooperation have been identified, including high recycling rates and waste reduction in all five countries, as well as their leading role in the development of circular business models and technologies. On the other hand, it found challenges for Nordic cooperation, including harmonizing regulations across national borders and scaling up innovation to meet the growing demand for green products. This study concludes that Nordic cross-border cooperation is an example of regional integration in the circular economy. By combining policy harmonization, innovation, and shared resources, these countries are accelerating the transition to a sustainable future by jointly addressing challenges. Their success highlights the power of regional partnerships in addressing global environmental challenges.

## SUSTAINABILITY AND COMPETITION POLICY - VIA CONSUMER PROTECTION

**Mirza Radu**

*Henri Capitant NGO, Moldova*

[radumirza@gmail.com](mailto:radumirza@gmail.com)

### Abstract

Approaching the 2030 deadline for achieving sustainable development goals progressively intensifies the need to evaluate the relationship between sustainability objectives, competition policy, and consumer protection. Thus, the examination on the possibilities of alignment and cooperation between these three pillars towards a more sustainable, competitive, and consumer-friendly economy comes to the fore.

An analysis of the foundational principles underlying sustainability, competition, and consumer protection, reveals inherent tensions but also synergies, as an efficient economy driven by competition can either complement or conflict with broader sustainability goals and consumer protection objectives. The focus of EU institutions on environmental and competitive elements of the circular economy, with barely a mention of the social and consumer-related aspects being an expressive negative example of this interaction.

Achieving sustainability goals relies significantly on the understanding of the role of competition policy in promoting sustainability. However, a narrow focus on this aspect, without due consideration of the consumer's role, risks violating their rights, undermining as such the very core of our political systems – the protection of human rights and freedoms.

Therefore, this research analyses the current state of competition policy in Europe, assessing its compatibility with sustainability and consumer protection objectives. It explores opportunities to integrate the regulations addressing practices like abuse of dominant position, anti-competitive agreements, mergers, or state aid, and aiming for a greener and more sustainable economy - into a framework that incorporates consumer perspectives. Moreover, an analysis of potential conflicting cases of such a regulation and consumers' rights would benefit to underscore the aspects in need of further attention from the regulators in order to prevent or resolve conflicts effectively.

In conclusion, this paper contributes to the ongoing discourse on sustainability, competition, and consumer protection by providing insights into the challenges, opportunities, and policy options for achieving a harmonious balance between these imperatives in the European context.

**Key Words:** Sustainable development, consumer protection

### THE ROLE OF CIRCULAR ECONOMY IN SUSTAINABLE DEVELOPMENTS GOALS IN ALBANIA

DOI: 10.26341/issn.2241-4010-2025-16a-2-K02215

**Hysaj Albina**

*Epoka University, Tirana, Albania*

[albinahysaj@gmail.com](mailto:albinahysaj@gmail.com)

#### Abstract

This article aims to explore the role of the circular economy towards the accomplishment of Albania's Sustainable Development Goals by emphasizing the developments of sustainable practices in areas such as waste management, resource efficiency, and environmental conservation. Aiming to align the country's practices with EU standards, Albania has integrated the circular economy practices into several national policy frameworks and recently approved or reviewed environmental laws. Through collaboration with several international organizations, and the implementation of international projects, Albania has developed a Circular Economy Roadmap, focused on green procurement, producer responsibility and public engagement.

Even though there are significant developments especially in the alignment with EU standards, limited recycling infrastructure, low waste separation rates, low public awareness, and inadequate regulatory implementation are considered significant obstacles in the process of transition from linear to circular economy. Enhancing the regulatory framework, promoting the public awareness, investing in the improvement of infrastructure, financing SME-s and improved collaboration among the public and private sector, would support an easier transition to circular economy and contribute to the job creation, environmental protection, and sustainable growth in Albania.

**Keywords:** Circular economy, sustainable development goals, Albania, EU integration.

#### Introduction

The Sustainable Development Goals are made of seventeen objectives aimed at achieving sustainable development, with a strong emphasis on solving several social, economic, and environmental concerns. The SDGs are published in 2015 by the UN General Assembly. Aimed to be accomplished by 2030, SDGs follow the Millennium Development Goals and shifts the global development direction toward sustainability. For developing nations like Albania, the Sustainable Development Goals are particularly significant because their achievement will indicate progress in fulfilling the prerequisites for EU membership. Albania has adopted the National Strategy for Development and European Integration 2015-2020 and integrated the Sustainable Development Goals since being granted EU candidate status in June 2014.

Several Sustainable Development Goals, especially goals associated with production and consumption, economic expansion, and environmental sustainability, are closely related to the

---

circular economy principles. Recognizing the role of the circular economy practices in achieving several Sustainable Development goals especially those that are related to production and consumption, resource management, waste management, competitiveness and innovation, environment protection, clean energy, economic growth and so forth, has leveraged the interest of the researchers and the policymakers toward circular economy implementation practices (Arruda et al., 2021; Moraga et al., 2019; Padilla-Rivera et al., 2020).

The circular economy has significant economic, environmental, and social impact. Ekins et al. (2019), Lewandowski (2016), and Rizos et al., (2017) show that switching from a linear to a circular economy seeks to decline environmental damage caused by non-reusable waste and so lessen reliance on non-renewable natural resources. A basic model of the circular economy is the pattern of utilizing the output of one product as the input for another, so generating a closed-loop system. McCarthy et al. (2018) also argue that optimizing the use of natural resources can help achieve environmental objectives, lower reliance on imports by using domestic secondary resources, and promote economic growth and job creation by circular economy practices.

The distinction between a linear economy and a circular economy is substantial. In a linear economy, resources are extracted, processed into products, consumed, and ultimately removed as waste. On the other hand, the circular economy operates within a closed-loop framework, where waste is minimized, and resources are continuously cycled back into the system. After products are used, they undergo processes such as recycling, recovery, repair, retention, and return, ensuring their ongoing utility and reducing environmental impact.

Ellen MacArthur Foundation (2015) describes the concept of circular economy by using butterfly diagram. The diagram illustrates the circulation of materials through two circles. The first cycle includes the activities and processes such as sharing, maintaining or prolonging, reusing, remanufacturing and recycling of the finite sources and is called the technical cycle. The second cycle includes all the activities and processes that ensure the regeneration of nature and natural renewable resources, and the sustainability of their utilization is called the biological cycle.

The implementation of circular economy is in the early development stages in Albania. However, a report of OECD (2024) highlights three critical focus areas where circular economy reforms could significantly benefit Albania. These include: (1) utilizing economic tools to promote sustainable production and consumption practices, (2) fostering the development of circular business models, especially among small and medium-sized enterprises (SMEs), and (3) tackling challenges within the plastics value chain, having a particular focus on combating marine pollution. Sustainable production and consumption can be achieved by increasing the recycling rate, extending the life of production and increasing the waste management. Business models play a crucial role in the implementation of circular economy.

The aim of this paper is to investigate the role of circular economy in the Sustainable Development Goals in Albania emphasizing the main obstacles and opportunities in the process of transition towards more sustainable practices in waste management, resource efficiency, and environmental conservation. Since receiving its candidacy for the European Union integration, Albania has undertaken several reforms focusing on the sustainable growth

## PROCEEDINGS

---

and development, with a special focus on green reforms, waste management, and increasing the infrastructure supporting the circular economy.

Albania is in the earliest steps of implementation of circular economy. Based on the statistics of the Albanian Institute of Statistics (2022), the recycling rate of municipal solid waste in Albania is only 17%, which is significantly lower compared to the EU average of 49% (Eurostat, 2022). Based on the report of Lloyd's Register Foundation (2024) entitled World Risk Poll 2024 Report, 78% of the household in Albania has responded not to practice any waste separation at the source, which is a very high percentage compared to the 63% which is the average for the low-income countries, emphasizing the low public awareness and the need for increased public participation and improved waste management infrastructure.

### Literature Review

Several research papers have examined the connection between the circular economy implementation indicators and the compliance with SDGs and have achieved significant results. Rodriguez-Anton et al., (2019) investigate the correlation between nine indicators of circular economy and SDGs, in 156 countries with data as of 2017. The chosen indicators are organized in four groups, such as production and consumption indicator, waste management indicator, secondary raw materials indicator and competitiveness and innovation indicator. The authors investigate the correlation between the chosen indicators and SDG 6, 8, 9, 11, 12, 13, 14, and 15. The findings of the study suggests that there is found a relationship of all CE indicators with SDG 8, 9, 11, 12 and there is found a relationship of at least one of CE indicators with SDG 13 and SDG 14.

Fatimah et al., (2020) give a valuable contribution by developing and designing the smart systems and business processes for the waste management in Indonesia. They use internet of things to integrate the application of the circular economy processes. The authors conclude that the system they have designed to implement the circular economy will have a significant influence on the Sustainable Development Goals such as SDG 3, 6, 8, 12 and 13. Their system is designed to have vital economic, social and environmental impact. Another study by Dantas, et al., (2021) aims to investigate the impact of both circular economy and Industry 4.0 on the Sustainable Development Goals. By conducting a systematic literature review, the authors find that the incorporation of Circular Economy and Industry 4.0 has a pivotal impact on the SDGs as it ensures the incorporation of innovative technology, circular production practices and business models. The impact is particularly significant in SDG 7, 8, 9, 11, 12, and 13.

Ronzon and Sanjuan (2020) examine the relationship between EU bioeconomy strategy and sustainable Development Goals in 28 EU countries for the period from 1990 until 2018 by using a bivariate correlation and mapping the 2018 EU bioeconomy strategy with SDGs. The results of their study suggests a positive relationship among bioeconomic strategy and SDG 7, 11, and 15. However, there is a negative correlation between agrobiodiversity strategies and SDG 2, SDG 8, SDG 9, and SDG13. Schroeder, Anggraeni, & Weber (2018) use a narrative literature review to analyse the relation between circular economy and sustainable development goals. The findings suggest that the practices of circular economy have a positive direct strong contribution to SDG 6, 7, 8, 12, 15. Furthermore, Circular

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

Economy may give a significant contribution on potential synergy among several SDGs such as SDG 8, 1, 2, 14, and 15.

Also, Ferraz & Pyka (2023) conduct a bibliometric analysis 649 research papers for the period 2007-2022, and systematic literature review of 81 articles to investigate the impact of circular economy and bioeconomy on sustainable development goals. The authors conclude that the circular economy primary impacts SDG12, continuing SDG7, 6. Furthermore, bioeconomy impacts SDG 7, 9, and 12.

## Methodology

As Albania is still in its early phases of implemented circular economy, this study employs a desk research approach to analyse the role of the circular economy in achieving Albania's Sustainable Development Goals. The research methodology of this study consists of using available data, articles, reports to have a descriptive analysis of the topic of study. The key concepts of conducting the research are circular economy and sustainable development goals in the context of Albania. To look for those concepts are used scientific research search engines such as Science Direct, Google Scholar, Semantic Sholar, RePEc and SSRN. For reports and data mostly are used the websites of OECD, United Nations, The World Bank, Eurostat, European Commission, the Albanian Institute of Statistics, and so forth. One of the most important limitations of this methods stands in the fact that the analyse may not go into deep details.

## Findings and Discussions

Albania's shift to a circular economy is in its nascent stages, characterized by both emerging opportunities and persistent challenges. The integration of circular economy practices into Albania's policy framework has been primarily driven by the National Waste Management Strategy (2018-2033) and various environmental protection laws designed to align with EU standards. The implementation of several national strategies and the improvement of the regulatory framework emphasize Albania's commitment to aligning with sustainable development goals, particularly within the context of its EU integration aspirations.

In the framework of application of the circular economy, Albania has development the Circular Economy Roadmap, which relies on three main pillars: green public procurement, extended producer responsibility, and public awareness campaigns. The Circular Economy Roadmap serves as a guideline to the Albanian government by providing several policy recommendations and monitoring frameworks to facilitate and track the transition to circular economy. Albania's transition to circular economy is also supported by the European Union institutions and the UNDP which have continuously offered technical assistance and funded several projects, contributing to the facilitation of the capacity-building and the adoption of best practices from other European countries.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The implementation of the circular economy in Albania is supported by business models in several areas, such as waste management, agriculture, textiles, tourism, and renewable energy, which are crucial to achieving sustainable development Goals (Hysaj, 2024). Sustainable Goal 12, related to Responsible Consumption and Production, is the focus of the main pillars of circular economy, such as sustainable resource use, waste generation reduction, and recycling practices (Schroeder, Anggraeni, & Weber, 2018). Moreover, Sustainable Development Goal 8, related to Decent Work and Economic Growth, and Sustainable Development Goal 9, related to industry, innovation, and infrastructure, is supported by the promotion of recycling, waste management, and eco-innovation sectors (McCarthy et al., 2018; Ferraz & Pyka, 2023). Sustainable Development Goal 6, Climate Action, is promoted by the policies and laws aiming to lower the greenhouse gas emissions through waste management and energy efficiency. Moreover, the promotion of renewable energy supports the achievement of Sustainable Development Goal 7, Affordable and Clean energy (Ferraz & Pyka, 2023; Schroeder et al., 2018).

Regardless of the significant developments that enable the application of circular economy practices, this process faces considerable barriers. These barriers are related to the limited and inadequate recycling infrastructure, low levels of waste separation at the source from the households, and gaps in regulatory enforcement. Even though several EU projects are supporting the country's advancement toward this direction, the limited financial incentives and low awareness among businesses and consumers makes the transition difficult and slow. Moreover, small and medium-sized enterprises, which represent over 99% of Albania's businesses, often lack the technical expertise and resources needed to adopt circular business models (OECD, 2019).

Regardless of the barriers and challenges faced there are numerous local initiatives aiming to ease the application of circular economy. Municipalities of Tirana and Durrës have launched several projects aiming to improve the waste management systems, to encourage recycling, and to promote the usage of clean energy, furthermore, directly contributing to SDG 11, associated with Sustainable Cities and Communities, SDG 12 associated with Responsible Consumption and Production, and SDG 7, associated with Affordable and Clean Energy. Furthermore, the encouragement of public-private partnerships, educational initiatives, integration of the circular economy concept into university curricula, and collaboration with academia are widely used practices used to promote community involvement in sustainable practices and increase awareness especially among young generations.

## Conclusions

This study analyses the contribution of circular economy in the fulfilment of Albania's Sustainable Development Goals (SDGs), focusing on the goals associated with responsible consumption and production, economic growth, sustainable cities and communities and environmental sustainability. Albania has made significant efforts to incorporate circular economy principles within its national policies, aligning with EU environmental standards and fostering international cooperation.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

On the other hand, the transition to a fully functional circular economy in Albania is still a work in progress. The primary obstacles include infrastructural deficiencies, weak regulatory enforcement, limited financial incentives, and insufficient public awareness. To overcome these challenges, it is crucial to strengthen institutional capacities, enhance stakeholder engagement, and promote innovative business models that support circular practices.

Key policy recommendations derived from this study include:

- **Enhancing Regulatory Frameworks:** Strengthening the enforcement of existing environmental regulations and introducing new policies that incentivize circular economy practices.
- **Promoting Public Awareness:** Implementing nationwide educational campaigns to encourage a culture of sustainability among citizens and businesses. Integrating the circular economy concepts into university curriculum.
- **Supporting SMEs:** Providing technical assistance, financial incentives, and capacity-building programs to help SMEs adopt circular business models as the SMEs make 99% of businesses in Albania and they have limited financial sources.
- **Encouraging Public-Private Partnerships:** Leveraging partnerships between government entities, businesses, and civil society to induce innovation and investment in circular economy initiatives.
- **Improving Infrastructure:** Investing in modern waste management and recycling facilities to support efficient resource recovery and reduce environmental impact.

Moreover, financing the infrastructure to facilitate clean energy

In conclusion, although Albania faces considerable challenges in its circular economy transition, the opportunities for sustainable growth, environmental protection, and economic resilience are significant. By addressing the existing the internal barriers and benefiting from its international strategic partnerships, Albania has the opportunity to move forward with a more sustainable growth and development.

# ADVANCING CLIMATE NEUTRALITY THROUGH CIRCULAR ECONOMY SANDBOXES: A FRAMEWORK FOR INNOVATION AND REGULATION

**Zamfir Natalia**

*Moldova State University, Chishinau, Moldova*

[natalia.zamfir@usm.md](mailto:natalia.zamfir@usm.md)

**Lisnic Iurie**

*Moldova State University, Chishinau, Moldova*

[iurie.lisnic@gmail.com](mailto:iurie.lisnic@gmail.com)

## Abstract

Decoupling economic growth from resource use and transitioning to circular systems of production and consumption are essential to achieving climate neutrality by 2050.

The current economy favours excessive consumption and endangers natural resources. The activities of extraction, processing and disposal of materials generate various negative environmental impacts, including the increase of greenhouse gas emissions, which jeopardise the achievement of essential environmental protection goals. It is imperative to promote stricter resource efficiency policies and to advance the circular economy throughout the value chain, replacing traditional business models with circular ones.

The failure to accelerate innovation in the circular economy is more evident than ever. Innovators face the challenge of framing their innovative solutions within the relevant laws, policies, standards, norms and specifications set by regulators during the development and implementation phases.

The Circular Economy Sandbox is essential for promoting innovative experimentation by providing a flexible regulatory framework that facilitates the temporary testing of innovative products, technologies, services and business models. This mechanism allows for temporary exemptions from certain restrictive legal regulations, such as those related to spatial planning, construction, environmental protection or tax procedures, while ensuring fiscal compliance. The implementation of sandboxes thus contributes to accelerating the transition to sustainable solutions and to creating an environment conducive to innovation.

**Keywords:** circular economy, economic growth, climate neutrality

### **EMPOWERING CONSUMERS FOR CIRCULAR FOOD SYSTEMS: INSIGHTS FROM HUNGARIAN RESEARCH ON SUSTAINABILITY AND CONSUMPTION PATTERNS**

**Csizmady Adrienne**

*HUN-REN Institute for Sociology, Center for Social Sciences, Budapest, Budapest, Hungary*  
[csizmady.adrienne@tk.hu](mailto:csizmady.adrienne@tk.hu)

#### **Abstract**

The circular economy (CE) concept has emerged as a pivotal framework for fostering sustainable consumption, particularly within the food sector. In Hungary, recent studies have examined CE principles in relation to organic food purchasing behavior, consumer awareness, and segmentation, highlighting young, educated urban consumers as key drivers of circular innovation (e.g., Fogarassy et al., 2020; Berecz & Fogarassy, 2022). However, challenges persist, such as developing robust indicators for nutrient circularity and addressing gaps in bio-economy integration (e.g., Fassio & Chirilli, 2023). Research on CE in food systems often focuses on waste reduction, sustainable packaging, and supply chain optimization (e.g., Zhang et al., 2022), yet more attention is needed on empowering consumers as active participants in circular practices.

Recent findings highlight the nuanced dynamics of sustainable food consumption in Hungary, including the role of cultural capital in shaping consumer engagement. For example, Kristóf and Megyesi (2024) reveal how sustainability manifests in both "hip" and practical forms, underscoring the duality of consumer behavior in this domain. Furthermore, the integration of nature-based solutions (NBS) in urban planning, as explored by Megyesi et al. (2024), provides valuable insights into stakeholder perceptions that can inform CE strategies, especially in fostering inclusive and participatory approaches.

This presentation explores the Hungarian context through survey and interview data derived from a recently concluded H2020 project and an ongoing research initiative. These studies examine how shifts in sustainability awareness and consumption patterns can support CE transitions. We emphasize the role of consumers as proactive agents, advocating for inclusive engagement in sustainable development processes. By highlighting the social dimensions of CE, this research aligns with ECO4ALL's focus on integrating consumer participation and regulatory frameworks to advance resource efficiency and full circularity.

**Key words:** consumers' attitude; direct food purchasing; short food supply chains; local food system

## SUSTAINABILITY, CIRCULAR ECONOMY AND CREATIVE COMPUTING

**Cunha Carlos**

*Lisbon University Institute, Lisbon, Portugal*

[cunhacdowling@yahoo.com](mailto:cunhacdowling@yahoo.com)

### Abstract

Currently, there is an increasing concern about sustainability and robustness of complex infrastructures upon which many of our day-to-day activities depend. In the European Union, the term circular economy is a well-established element of the European Green Deal, describing a transformation towards greater sustainability and waste reduction. Many of us work in fields related to creative computing and have spent time researching the right to repair and other sustainable practices related to creative computing. Open Educational Materials will be presented that provide an opportunity for educators and learners to explore these ideas based on practical examples and accessible activities. This material is available for non-commercial re-use under the Creative Commons License. It comprises of a slide deck and supporting materials, both available for free on the website <https://costgrade.eu>. The slide deck may be used during lessons in secondary school in both formal and informal settings. Educators may also edit and re-use the material in their own teaching tools. The supporting materials file includes descriptions of each slide, and suggestions for further reading. This material was created by Grassroots of digital Europe (GRADE), a network of scientists, researchers, activists, and artists from the EU and beyond, created within the COST framework for European Cooperation in Science and Technology. GRADE Working Group WG2, Institutionalising digital grassroots, is responsible for the creation and distribution of these materials.

**Key words:** Sustainability, circular economy, creative computing, Open Educational Materials

# LEGAL ANALYSIS OF CONSUMER RIGHTS TO PRODUCT REPAIR UNDER THE EU DIRECTIVE ON REDUCING, REUSING AND REPAIRING

DOI: 10.26341/issn.2241-4010-2025-16a-3-K02224

**Dumančić Kosjenka**

*Faculty of economics and business University of Zagreb, Zagreb, Croatia*

[kdumancic@efzg.hr](mailto:kdumancic@efzg.hr)

## Abstract

This paper provides a comprehensive legal analysis of the time limits governing consumers' rights to claim and request product repairs. It focuses on the new EU Directive promoting product lifecycle extension through reducing, reusing, and repairing. The Directive mandates that manufacturers and sellers enable product repairs up to ten years from the date of manufacture, marking a significant advance towards sustainable consumption and enhanced consumer protection, but only for certain kinds of goods.

Scientific contribution lies in the author's critical examination of the intersection between the newly introduced obligations under the Directive and existing consumer rights under warranties and guarantees. By analysing potential overlaps and conflicts, the paper sheds light on the legal implications and challenges of harmonising these rights within current legal frameworks in selected member states.

The critical legal questions to be addressed will include alignment with existing laws and determining how the directive's mandate for repair for up to ten years aligns with existing national laws on warranties and guarantees. Additionally, stakeholders' responsibilities will be examined in relation to the analysis of the legal obligations of manufacturers and sellers under the Directive, as well as their interactions with consumers' rights to claim defects. In conclusion, the implementation challenges will be addressed to ensure the effective implementation of the Directive into national legislation.

By addressing these questions, the paper aims to provide actionable recommendations to facilitate the effective implementation of the Directive. The findings contribute to the broader discourse on consumer law reform, environmental sustainability, and the integration of circular economy principles into legal systems.

**Keywords:** Consumer rights, R2R Directive, guarantee, sustainability, legal analysis.

## 1. Introduction

The intensifying global awareness of environmental degradation and the imperative for sustainability have spurred unprecedented legislative action worldwide. The European Union is at the forefront of enacting comprehensive policies to mitigate the adverse consequences of unsustainable production and consumption patterns ([Luzak, 2020](#)).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The European Union has been progressively advancing a comprehensive framework to foster a circular economy, with a significant emphasis on enhancing product durability, reparability, and reusability ([Boniface et al., 2024](#)). This commitment is reflected in various policy initiatives and legislative measures designed to encourage sustainable production and consumption patterns across member states ([Camilleri, 2020](#)). The ambitious goals of the circular economy include minimizing waste, reducing material demand, and promoting the efficient use of resources throughout the product lifecycle ([Mikula et al., 2020](#)). Among the key instruments driving this transition is the EU Directive on Reducing, Reusing, and Repairing (Directive (EU) 2024/1799 of the European Parliament and of the Council of 13 June 2024 on common rules promoting the repair of goods and amending Regulation (EU) 2017/2394 and Directives (EU) 2019/771 and (EU) 2020/1828; further in text: Directive on Reducing, Reusing and Repairing or Right to Repair Directive (R2R Directive) which seeks to empower consumers with enhanced rights related to product repair, thereby promoting a culture of repair over replacement and contributing to a more sustainable and resource-efficient economy ([Hernández et al., 2020](#)). This directive is strategically designed to tackle premature obsolescence and encourage manufacturers to create more durable, repairable, and easily disassembled products. By establishing a legal framework that supports and protects consumer rights to repair, the EU aims to incentivize manufacturers to prioritize product longevity and facilitate access to repair services and spare parts ([Hernández et al., 2020](#)). The directive's provisions aim to create a level playing field, ensuring that consumers are not unduly pressured into purchasing new products when their existing ones can be repaired, thereby extending product lifecycles and reducing environmental impact.

The R2R Directive represents a pivotal step towards a more sustainable and circular economy within the European Union, addressing critical aspects of product design, consumer rights, and waste reduction ([Pangburn & Stavroulaki, 2022](#)). It aims to establish a robust legal framework that empowers consumers to opt for repair over replacement, thereby extending the lifespan of products and reducing environmental impact.

This paper examines the EU legal framework on promoting repair as a pivotal step towards sustainable consumption and waste reduction within the European Union. A central problem it addresses is the prevailing "throwaway culture," which is incentivized by manufacturers designing products for obsolescence rather than durability and reparability. This problem will be tackled through a detailed legal analysis based on the European consumer protection legal framework.

This research explores the scope of consumer rights, the obligations imposed on manufacturers and sellers, and the mechanisms for enforcement, including the role of Member States with varying consumer protection standards. The Directive's legal, economic and environmental impacts will be analysed, considering its potential effects on businesses, consumers, and the environment. Furthermore, by examining the Directive's interaction with existing EU legislation, such as the Eco-design Directive, this article aims to provide a comprehensive understanding of its potential and challenges in promoting a more sustainable and circular economy ([Boniface et al., 2024](#)).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### 2. Objectives of the EU Directive on Reducing, Reusing and Repairing

The Directive on Reducing, Reusing, and Repairing addresses the unsustainable consumption patterns that have become a hallmark of modern economies. The core objective is to create a harmonised set of rules across member states that promote the repairability of goods, ensuring that consumers have access to the necessary information, spare parts, and repair services. Furthermore, it aims to incentivise manufacturers to design more durable, easily repairable products that are less prone to premature obsolescence, fostering a culture of sustainability and resource efficiency.

By establishing a legal framework that supports and protects consumer rights to repair, the EU aims to incentivise manufacturers to prioritise product longevity and facilitate access to repair services and spare parts ([Hernández et al., 2020](#)). This approach aims to promote sustainable consumption and minimise waste.

The directive acknowledges the significant role that consumer behaviour plays in the transition to a circular economy, recognising that informed purchasing decisions and a willingness to repair products can drive demand for more sustainable goods and services. Ultimately, the EU Directive on Reducing, Reusing, and Repairing represents a multifaceted approach to promoting sustainable consumption and production patterns, aiming to create a more resilient and environmentally responsible economy that aligns with the principles of a circular economy. This Directive strengthens provisions related to the repair of goods, contributing to the proper functioning of the European Union's internal market and providing a high level of consumer and environmental protection ([Directive, 2024](#)). The directive's provisions aim to create a level playing field, ensuring that consumers are not unduly pressured into purchasing new products when their existing ones can be repaired. Thus, the directive extends product lifecycles and reduces environmental impact.

The genesis of the EU Directive on Reducing, Reusing, and Repairing lies in the European Union's broader commitment to transitioning towards a circular economy, a model that emphasises resource efficiency, waste reduction, and sustainable consumption ([Weale et al., 2002](#)). Recognising the limitations of the traditional linear "take-make-dispose" economic model, the EU has prioritised the development of policies and regulations that promote the reuse, repair, and recycling of products and materials ([Chiaraluce et al., 2021](#)). The Directive emerged as a direct response to growing concerns about premature obsolescence, the environmental impact of discarded products, and the need to empower consumers with greater control over the lifespan of their goods. It also aligns with the design for disassembly, remanufacturing, and recycling ([Hernández et al., 2020](#)). Academic research has highlighted the critical role of consumer behaviour in driving the transition to a circular economy, noting that consumers can either support or hinder this transition through their purchasing decisions ([Jones & Comfort, 2021](#)).

The primary objective of the Directive is to establish a comprehensive legal framework that promotes the repairability and longevity of products, thereby reducing waste and conserving resources. This involves a multi-pronged approach that includes enhancing consumer rights, incentivising manufacturers to design more durable and repairable products, and facilitating access to repair services and spare parts. By empowering consumers to choose repair over replacement, the Directive aims to extend the lifespan of products, reduce the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

demand for new goods, and minimise the environmental footprint associated with manufacturing and disposal. The absence of incentives to design products and buildings for disassembly and reuse at the end of their life is a significant challenge ([Adams et al., 2017](#)).

The Directive aims to address several key challenges that hinder the widespread adoption of repair practices ([Mak & Lujinovic, 2019](#)). One such challenge is the limited access to repair information and spare parts, which often makes it difficult or impossible for consumers to repair their products. Another challenge is the perceived high cost of repair compared to the cost of replacing a product, which can discourage consumers from choosing repair even when it is technically feasible ([Sevcenko et al., 2019](#)). The directive is designed to encourage a circular consumption pattern ([Rahla et al., 2021](#)). It aims to promote the development of a robust repair sector, creating new economic opportunities and supporting the growth of local repair businesses.

### 3. Core Provisions and Consumer Rights under the R2R Directive

The EU Directive on Reducing, Reusing, and Repairing introduces a range of provisions aimed at enhancing consumer rights and promoting the reparability of products. One of the most significant aspects of the Directive is the establishment of a "right to repair," which grants consumers the legal entitlement to have their products repaired by manufacturers or authorised repairers.

This right extends to a wide range of goods, including electronics, household appliances, and other consumer products, ensuring that consumers are not unduly pressured into purchasing new items when their existing ones can be repaired. The Directive requires manufacturers to provide access to repair information, diagnostic tools, and spare parts to both consumers and independent repairers, thereby facilitating the exercise of the right to repair ([Jin et al., 2022](#)).

This right extends beyond the warranty period, ensuring that consumers can access repair services throughout the reasonable lifespan of a product. The Directive requires manufacturers to provide consumers with clear and comprehensive information about the reparability of their products, including details on the availability of spare parts, repair manuals, and diagnostic tools. This information must be easily accessible and user-friendly, enabling consumers to make informed decisions about whether to repair or replace their products. Furthermore, the Directive requires manufacturers to design products that facilitate repair, using standardised components and avoiding the use of proprietary tools or techniques that could restrict access to repair.

The right to repair is a significant development that allows individuals to reclaim and tinker with old technologies ([Hatta, 2020](#)). To further incentivise repair, the Directive encourages member states to implement measures that reduce the cost of repair services, such as tax breaks, subsidies, or the establishment of repair vouchers. These measures aim to repair a more economically attractive option for consumers, encouraging them to choose repair over replacement. Additionally, the Directive encourages the development of repair networks and community repair initiatives, enabling consumers to access affordable and convenient repair services.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The Directive also addresses the issue of planned obsolescence, the practice of designing products with a limited lifespan to encourage repeat purchases. While explicitly prohibiting planned obsolescence is challenging due to difficulties in proving intent, the Directive takes steps to combat this practice by requiring manufacturers to ensure that spare parts are available for a reasonable period after a product is discontinued. This provision aims to prevent manufacturers from deliberately shortening the lifespan of products by limiting access to spare parts. The Directive introduces several key consumer rights related to product repair and maintenance.

First, consumers can request repair services from manufacturers or authorised repairers, regardless of whether the product is still under warranty. Second, consumers have the right to receive clear and transparent information about the cost of repair services before agreeing to proceed with the repair. The provisions of the directive are designed to keep repair costs minimal, making it a viable option for consumers. Third, consumers are entitled to a warranty extension for repaired products, ensuring that the repair is carried out to a satisfactory standard and that any subsequent defects are covered. Fourth, consumers can seek redress if a repair is not carried out correctly or if the product fails again after the repair.

These consumer rights are designed to empower consumers and provide them with the confidence to choose repair over replacement, contributing to a more sustainable and circular economy. The lack of consumer awareness regarding product care has also been identified as a reason why consumers either do or do not take care of their products ([Ackermann, 2018](#)).

### **4. Analysis of the Legal Framework and Scope of the Directive**

The EU Directive on Reducing, Reusing, and Repairing is a complex legal instrument with a broad scope that encompasses various aspects of product design, manufacturing, and consumer rights. To fully understand its implications, it is essential to analyse the legal framework underpinning the Directive and clarify its scope of application.

The EU Directive places significant obligations on manufacturers to ensure the repairability and longevity of their products. Before the introduction of this Directive, consumer repair rights within the EU were mainly governed by Directive (EU) 2019/771 on the sale of goods. This directive provides for a minimum two-year legal guarantee period during which consumers can seek remedies, including repair, for defective goods. Nonetheless, implementation of these rights has varied across Member States, often resulting in disparate levels of consumer protection.

The Directive mandates that manufacturers design products with repairability in mind, using standardised components, avoiding proprietary tools, and providing clear disassembly instructions. The product should be designed to facilitate a seamless repair process. Furthermore, manufacturers must make spare parts, repair manuals, and diagnostic tools available to consumers and independent repairers for a reasonable period after discontinuing a product. Legal guarantees under Directive 2019/771 are supplemented by commercial guarantees voluntarily offered by sellers or manufacturers. These guarantees differ in duration, scope, and conditions and often do not align with the more extended repair obligation now mandated under the new Directive.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The new Directive extends beyond the scope of Directive 2019/771 by ensuring repairability throughout the product's lifespan, not just during the initial guarantee period. This is a significant shift towards promoting sustainable consumption patterns. The Directive also introduces the concept of "extended producer responsibility", requiring manufacturers to take greater responsibility for the end-of-life management of their products. (Weale et al., 2002) This includes incentivizing repair and reuse as well as ensuring the proper collection and recycling of products that cannot be repaired. The Directive aims to shift the focus from a linear "take-make-dispose" model to a circular economy model, where products are designed to last longer, be easily repaired, and ultimately recycled (Chen, 2019). Furthermore, the new Directive aims to overcome barriers to repair, such as limited access to spare parts and repair information, by requiring manufacturers to provide this information to consumers and independent repairers.

### 5. Interaction with the existing Consumer Rights

This Directive does not exist in a vacuum; it interacts with a well-established body of consumer rights legislation at both the EU and Member State levels. Understanding this interaction is crucial for effective implementation and to avoid unintended consequences.

As mentioned above, the Directive complements the existing EU directives, such as the Eco-design Directive and the Consumer Rights Directive. While the Eco-design Directive focuses on setting minimum standards for product durability and energy efficiency, this new Directive tackles the barriers to repair, ensuring that consumers can exercise their right to extend the lifespan of their products. It also reinforces aspects of the Consumer Rights Directive by clarifying the remedies available when goods are faulty and emphasising the importance of providing clear and accessible information to consumers (European Commission, 2023). Consumer protection law ensures the defence of the collective interests of consumers in the internal market (Chaudhary, 2005). Member States are free to adopt measures that offer a higher level of consumer protection, as long as this is compatible with Union law (Weale et al., 2002).

The interplay between EU directives and national laws is equally important. Member States often have their specific regulations regarding consumer protection, product liability, and waste management. These national laws may impose additional or more stringent requirements than those outlined in EU directives. When implementing the new Directive, Member States must ensure that their national laws are aligned with the Directive's objectives while preserving any existing national provisions that offer a higher level of consumer protection.

Regarding the relationship with national consumer protection laws, Member States have varying levels of consumer protection agencies and legal frameworks. Some, like Germany, France, and the Netherlands, boast strong consumer protection traditions, well-established consumer organisations, and proactive enforcement agencies (Cuijpers, 2009; Giliker, 2016).

Others, particularly in Southern and Eastern Europe, may have weaker systems due to limited resources or a less developed tradition of consumer activism. The Directive should be implemented to respect these existing national frameworks while ensuring a minimum level of consumer protection across the EU (Chaudhary, 2005).

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

The Directive introduces the concept of "extended producer responsibility," which requires manufacturers to assume greater responsibility for the end-of-life management of their products. However, the specific details of these schemes are left to the discretion of each Member State, which may lead to inconsistencies in the application of the Directive and potentially undermine its effectiveness ([Kanamugire & Chimuka, 2014](#)). Clear guidelines from the Commission are needed to ensure a level playing field and prevent regulatory arbitrage.

Careful attention must be paid to potential conflicts with existing EU legislation, such as the Eco-design Directive. While both directives aim to promote sustainable products, their specific requirements may overlap or contradict each other. For example, stricter energy efficiency standards under the Eco-design Directive might inadvertently make products more difficult to repair. Policymakers need to ensure that the two directives are implemented in a coherent and mutually supportive manner ([Giliker, 2016](#)).

### 6. Legal Challenges and Implementation Issues

Prior to the introduction of the EU Directive, consumer repair rights within the EU were largely governed by Directive 2019/771 on the sale of goods. This directive provides a minimum two-year legal guarantee period during which consumers can seek remedies, including repair, for defective goods.

However, implementing these rights has varied across Member States, often resulting in disparate consumer protection. The new Directive strengthens consumer rights related to repair by working in conjunction with existing consumer protection laws, such as the Sale of Goods Directive (2019/771). While the Sale of Goods Directive provides a minimum two-year legal guarantee period during which consumers can seek remedies, including repair or replacement, for defective goods, the new Directive extends beyond this period by promoting reparability throughout the product's lifespan.

The new EU Directive interacts with existing consumer rights frameworks, particularly those established by Directive 2019/771, by expanding the scope and duration of repair rights. It supplements the existing two-year guarantee period by ensuring that manufacturers make spare parts and repair information available for a longer period, even after the guarantee has expired.

The implementation of the EU Directive faces several legal challenges and potential implementation issues. One key challenge is ensuring effective enforcement of the Directive's provisions across all Member States ([Errington & Childe, 2013](#)). Variations in national legal systems and enforcement mechanisms could lead to inconsistencies in applying the Directive, potentially undermining its effectiveness. Furthermore, the Directive's success depends on active consumer awareness and engagement. Many consumers may be unaware of their new repair rights or face practical barriers to accessing repair services. Overcoming these challenges requires a multi-faceted approach, including robust enforcement mechanisms, consumer education campaigns, and support for independent repair networks.

Another challenge lies in balancing the interests of consumers, manufacturers, and repair service providers. The Directive aims to incentivize manufacturers to design more repairable products, which may require significant investments in product design and manufacturing

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

processes. Some manufacturers may resist these changes, arguing that they could stifle innovation or increase production costs. The Directive requires Member States to establish effective monitoring and enforcing compliance systems, including imposing penalties for non-compliance. However, each Member State is left to determine the specific details of these enforcement mechanisms.

To ensure consistent and effective enforcement across the EU, the Commission should develop guidelines for Member States on best practices for monitoring compliance. Moreover, standardisation of repair procedures is crucial. Standardised diagnostic tools and repair manuals would facilitate the repair process, enabling independent repairers to compete effectively with authorised service centres.

The complexity of modern products, particularly electronic devices, poses a significant challenge to repairability. Many products are designed with proprietary components or software that can only be accessed by authorised repairers ([Lefebvre et al., 2018](#)). This creates a barrier to independent repair and limits consumer choice.

The EU Directive should encourage manufacturers to adopt open standards and provide independent repairers with access to necessary repair information and tools. This could lead to a fragmented enforcement landscape where the level of protection afforded to consumers varies depending on their location within the EU. Another legal challenge relates to interpreting and applying key concepts within the Directive, such as "reasonable cost" for repairs and "reasonable period" for the availability of spare parts. These concepts are inherently subjective and open to interpretation, which could lead to disputes between consumers, manufacturers, and repairers. To address this issue, the Commission should issue clear guidelines on the interpretation of these concepts, providing concrete examples and benchmarks to ensure consistent application across Member States.

The Directive introduces the concept of "extended producer responsibility", and this requires manufacturers to take greater responsibility for the end-of-life management of their products ([Hörnle et al., 2018](#)). However, the specific details of these schemes are left to the discretion of each Member State, which could lead to inconsistencies in the application of the Directive and potentially undermine its effectiveness.

The potential for conflicts with other EU legislation, such as the Eco-design Directive (2009/125/EC), requires careful attention because this directive establishes minimum energy efficiency standards for a wide range of products ([Stevels & Smit, 2019](#)). The Eco-design Directive aims to reduce the environmental impact of products throughout their life cycle, including setting requirements for product design, energy consumption, and durability ([Heyen et al., 2017](#)). It complements the new Directive by ensuring that products are designed to be more durable and energy-efficient from the outset.

## 6. Economic and Environmental Impacts

Assess the economic and environmental implications of the Directive, taking into account its potential impacts on businesses, consumers, and the environment. The Directive's economic impact is multifaceted, affecting businesses, consumers, and the repair sector in various ways. For businesses, the Directive introduces new obligations and costs related to the availability of spare parts, repair information, and product design for repairability ([Grigore & Kifor,](#)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

[2021](#)). Manufacturers may need to invest in redesigning their products to make them easier to repair and establish systems for providing spare parts and repair information to consumers and independent repairers. These costs could be significant, particularly for smaller businesses that lack the resources to adapt quickly.

However, the Directive also presents opportunities for businesses. The increased demand for repairs could stimulate the growth of the repair sector, creating new job opportunities and business prospects for independent repairers and specialised service providers. Moreover, businesses that adopt the principles of repairability and sustainability can gain a competitive advantage, attracting environmentally conscious consumers who are willing to pay more for products designed to last.

On the consumer side, the Directive is expected to result in long-term cost savings. By making products more durable and repairable, consumers can avoid the need to replace them as frequently, reducing their overall expenditure on goods. The availability of spare parts and repair information will also empower consumers to repair their products themselves or seek out independent repair services, potentially saving money on costly manufacturer repairs. However, the initial cost of more durable and repairable products may be higher, which could be a barrier for some consumers.

The principles of the circular economy are crucial for achieving the Directive's goals because of their potential to promote efficient resource utilisation and minimise the environmental burdens associated with conventional linear production and consumption models ([Ruiz et al., 2019](#)). By emphasising product durability, repairability, and reuse, the Directive aligns with the circular economy's core tenets, encouraging a shift away from the "take-make-dispose" approach. The paradigm of regeneration is obvious in maintenance and retirement processes, where products are repaired, reused and disassembled ([Diez et al., 2016](#)).

## 7. Conclusion

The EU Directive on reducing, reusing and repairing represents a significant step forward in promoting sustainable consumption and waste reduction within the European Union. By granting consumers enforceable rights to product repair, the Directive addresses critical market shortcomings, incentivising manufacturers to design more durable and repairable products while empowering consumers to extend the lifespan of their goods.

The detailed legal analysis reveals the Directive's multifaceted nature, encompassing key aspects such as the scope of consumer rights, obligations imposed on manufacturers and sellers, and enforcement mechanisms. The Directive introduces a new legal framework that prioritises repair over replacement, challenging the prevailing culture of disposability that has contributed to environmental degradation and resource depletion ([Michelini et al., 2017](#)).

Moreover, the Directive's emphasis on access to spare parts, repair information, and independent repair networks is crucial for fostering a competitive and consumer-friendly repair market. This can lead to more significant innovation in the repair sector and more affordable repair options for consumers.

Looking ahead, the successful implementation of the Directive will require ongoing collaboration among policymakers, businesses, consumers, and other stakeholders.

# ENHANCING CIRCULAR ECONOMY THROUGH NATURE-BASED SOLUTIONS IN HIGHER EDUCATION

DOI: 10.26341/issn.2241-4010-2025-16a-4-K02225

**Manou Dimitra**

*School of Law, Aristotle University of Thessaloniki, Greece*

[dimitra.b.manou@gmail.com](mailto:dimitra.b.manou@gmail.com)

## Abstract

Circular economy entails core sustainability concepts, such as reducing waste, preserving the environment and recycling goods in order to promote sustainable development. Nature-based Solutions (NBS) have been identified as tools for protecting biodiversity and natural resources, thus supporting healthier ecosystems and leading to sustainable development. NBS includes the concept of circular economy, as by protecting and sustainably managing natural resources, natural cycles are enhanced and promoted. Both concepts lie in the heart of the European Commission's efforts to strengthen environmental protection and economic development at the European and global level. Higher Education Institutions (HEIs) as primary agencies of education and training, which are to deliver and promote Sustainable Development Goals (SDGs), are called to integrate those concepts not only into their everyday campus practices but in their courses and academic curricula as well.

This paper aims to explore the level of integration of those concepts in the Greek HEIs by examining and analyzing policies, strategies and initiatives at the campus level as well as by exploring relevant university curricula. It highlights the importance of interdisciplinary cooperation and innovative learning methods in order to leverage the integration of circular economy by implementing NBS in HEIs.

**Key words:** Circular Economy, Nature-based Solutions, Higher Education Institutions, sustainable development

## Introduction

Our societies need to take urgent action to address current environmental concerns, with climate change and biodiversity loss being the most pressing ones. International community's efforts have led to the adoption of the Sustainable Development Goals (SDGs), as tools to achieve the overarching goal of sustainable development (UNGA, 2015).

SDGs include inter alia the target of “Quality Education” (SDG 4) “that will allow many other Sustainable Development Goals (SDGs) to be achieved” (UNGA, 2015). Quality education is crucial for achieving sustainable development (Laurie R. et al., 2016) and current research focuses especially on the role of higher education institutes in promoting sustainable development and transforming their curricula towards sustainability and eco-citizenship (Lozano R. et al., 2013, Filho W. et al. 2019, Serafini et al. 2022). This transformation requires several reforms and integration of new concepts in academic teaching, such as the

## PROCEEDINGS

---

concepts of circular economy, nature-based solutions (NBS) and eco-citizenship, as well as new pedagogical approaches (Lozano R. et al. 2017, Martín-Garin A., 2021).

This article explores the integration of the concept of circular economy into higher education institutions (HEIs) programs, especially through other environmental concepts and particularly nature-based solutions (NBS). It aims at highlighting NBS and circular economy education programs in Greece and discussing the integration of these concepts in higher education institutions' curricula and campus policies. It emphasizes the need for state and institutional support for promoting innovative teaching programmes as well as the significance of interdisciplinary cooperation towards a greener and more inclusive higher education.

The paper is structured as follows: after the introductory part, the second part clarifies the research question and explains the methodology. Presentation of the research findings follows regarding the integration of NBS and circular economy in Greek universities' curricula and courses. Finally, conclusions and recommendations for future research are presented.

### **Research Question and Methodology of Research**

The concepts of Nature-Based Solutions (NBS) and circular economy have gained a lot of leverage in the last few years because of their significant potential to address environmental (as well as social) challenges and their dynamic in fostering global efforts towards biodiversity conservation and restoration and adapting to climate change.

According to the European Commission's definition, NBS are 'solutions that are inspired and supported by nature, which are cost-effective, simultaneously provide environmental, social and economic benefits and help build resilience; such solutions bring more, and additional diverse, nature and natural features and processes into cities, landscapes and seascapes, through locally adapted, resource-efficient and systemic interventions' (European Commission: European Research Executive Agency 2024). In literature, NBS have been identified as means of natural solutions which may address both environmental protection and social challenges (Viti M., 2022). Nature-based Solutions (NBS) are critical tools for restoring biodiversity and protecting natural resources, thus fostering healthier ecosystems and a green transition.

The United Nations Environmental Assembly (UNEP 2019) has attempted a definition of circular economy, or maybe “a shared understanding of some of its basic principles” (United Nations Economist Network, 2022). The United Nations Environmental Assembly has defined circular economy as “one of the current sustainable economic models, in which products and materials are designed in such a way that they can be reused, remanufactured, recycled or recovered (4-R) and thus maintained in the economy for as long as possible, along with the resources of which they are made, and the generation of waste, especially hazardous waste, is avoided or minimized, and greenhouse gas emissions are prevented or reduced” (UNEP 2019).

Circular economy entails sustainability concepts such as reducing waste, preserving the environment and recycling goods, as well as “sustainable management of natural resources, the closing of material loops, the preservation of natural capital, and circular consumption and production behaviours in the economy in order to promote sustainable development” (United

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Nations Economist Network, 2022). Nature-based Solutions (NBS) include the concept of circular economy, as by protecting and sustainably managing natural resources, natural cycles are enhanced and promoted.

Both concepts lie in the heart of the European Commission’s efforts to strengthen environmental protection and economic development at the European and global level. The economic benefits of nature-based solutions (NBS) and a nature-based economic approach can act in a complementary way to achieving circular economy (European Commission Knowledge Centre for Biodiversity, 2023).

Following these new targets and goals at the global as well as the EU level, and as Higher Education Institutions (HEIs) are considered primary agencies of education and training, they are expected to deliver and promote Sustainable Development Goals (SDGs) and SDG 4 in particular (Chankseliani, M., McCowan, T. 2021, McCowan T., 2023). Thus, higher education institutions are called to integrate circular economy, nature-based solutions and other sustainability concepts not only into their everyday campus practices (Nunes, B. T. et al., 2018) but in their courses and academic curricula as well (Stefanakis, A. I. et al., 2021). Integrating nature-based solutions and circular economy (Renfors, S.-M., 2024) into higher education institutions is a critical parameter towards sustainable transition (Salas, D. A. et al., 2021, Vergani F., 2024).

Therefore, the research question of this article is formulated in order to explore the current projects, programmes and initiatives which foster integration of NBS and circular economy in Greek universities and the possible barriers, challenges and obstacles which could impede educators in higher education institutions to integrate nature-based solutions and circular economy concepts in their courses and university curricula.

In order to explore the level of integration of NBS in Greek universities, the author of this article has elaborated previous desk research and field work in the framework of the Erasmus Plus Project "Integrating Nature-Based Solutions into Higher Education towards exploiting the transformative potential of Social Economy for a green and inclusive future" (acronym: “SEgoesGreen”), funded by the European Union (2022-1-PL01-KA220-HED-000087149) along with the rest of the partners of the project, aiming at identifying different best practices on nature-based solutions in different EU countries. The goal of the project was to support university faculties to integrate sustainability teaching within their courses and curricula with a specific focus on exploiting the educational potential of Nature-Based Solutions. SEgoesGreen aimed at a) offering flexible training tools and resources to HEIs educators, b) exploring the state of the art in NBS education, c) identifying any barriers against the integration of NBS in HEIs, d) promoting students’ interest in green education and eco-citizenship.

The research conducted in the framework of the project has explored the integration of NBS in universities and academic institutions in five European countries, namely Poland, Croatia, Greece, Cyprus and Portugal (Murzyn, D., et al. 2024). Desk research aimed at identifying the best practices in integrating NBS in the abovementioned countries and a combination of research methods has been used, such as best practices analysis, interviews with stakeholders and constructed discussions in small groups of professionals, educators, and other stakeholders. The author has built upon the research on nature-based solutions by

## PROCEEDINGS

---

adding the parameter of circular economy and focusing explicitly on the Greek higher education institutions.

### Research Findings

The first part of the research in the framework of the SEgoesGreen project identified a set of best practices in Greece by using specific parameters such as “the country and city of implementation, the field of study, the educational institution, the level of study, course(s), NBS category, topic of the best practice, its specific objectives, the results or impact achieved, stakeholders involved, pedagogical approaches utilised and any significant considerations pertinent to the best practice” ((Murzyn, D., et al. 2024).

Building upon the research conducted on Nature-based Solutions within the SEgoesGreen project, this article explored the level of integration of the concept of circular economy in Greek higher education institutions’ courses and curricula and focused particularly on the synergy creation between nature-based solutions and circular economy.

The first findings of this research on the integration of circular economy in Greek higher education institutions demonstrate that circular economy is gradually being integrated into Greek universities. However, the level of implementation varies across institutions, programmes and levels of tertiary education (master programmes, undergraduate programmes etc.). The integration of circular economy principles in Greek universities may be identified in courses and curriculum development, in research projects and initiatives, as well as in other sustainability projects, and collaborations with external stakeholders.

The most important methods and tools for integrating circular economy in Greek higher education institutions are first of all, through curriculum and academic programmes. During desk research it was found that Greek universities have started including the concept of circular economy, and the principles related to it, into their academic courses and programmes. Thus, one may find a number of specialized courses, modules, and entire degree programs, which focus on sustainability, environmental management, circular economy and sustainable consumption. For instance, the University of West Attica<sup>73</sup> and the Aristotle University of Thessaloniki<sup>74</sup> are currently offering courses related to sustainability and circular economy as part of their environmental sciences, engineering or business programs. Similarly, the Technical University of Crete (TUC), offers a master’s program for students on the topics of Circular Economy and Bioeconomy<sup>75</sup> and generally it is a university very much involved in sustainability research, trying to integrate the concept of circular economy into courses that examine sustainability and resource management.

Apart from the specialized programmed and courses, the Greek higher education institutions foster circular economy through research and collaborations with other universities and research centers abroad. They participate in and/or lead research projects that

---

focus on circular economy (i.e. funded projects<sup>76</sup> or international partnerships and collaborations<sup>77</sup>). Greek universities have also been very active in initiating or supporting respective research initiatives on relevant topics. Areas of focus include waste management, renewable resources, sustainable production processes, and others. The Athens University of Economics and Business<sup>78</sup> and NTUA<sup>79</sup> (National Technical University of Athens), actively participate in European and international research initiatives related to the circular economy, addressing issues like recycling, eco-design, and green technology. Greek HEIs also cooperate with research centers: for instance the Centre for Renewable Energy Sources<sup>80</sup> (CRES) in Greece focuses on developing sustainable energy solutions, which is closely tied to circular economy principles.

In addition, the Greek HEIs have developed and/or are developing collaboration schemes with the private sector and relevant government agencies. Almost all Greek universities are working closely with local businesses, municipalities, and governmental organizations to pilot circular economy practices. By developing such collaboration schemes, higher education institutions in Greece can offer their students real-world application of circular economy principles in various sectors of the economy, such as waste management, agriculture, and manufacturing. An example of this process is the collaboration of the Harokopio University of Athens with the Hellenic Recycling Agency<sup>81</sup> in the integrated LIFE project LIFE-IP CEI-Greece which aims to contribute towards the implementation of the National Waste Management Plan, the National Waste Prevention Plan and the National Strategy for Circular Economy. Other university departments work with local waste management organizations and municipal authorities in pilot projects that explore sustainable waste processing and resource management.

Another aspect of the Greek HEIs' engagement in circular economy and Nature-based Solutions are the initiatives developed for promoting sustainability and “greening” the universities' campuses. For instance the University of Patras<sup>82</sup> has established the Sustainable-Green University Committee which promoted a combination of nature-based solutions and circular economy practices, such as adopting circular economy solutions by promoting resource reuse practices, redesigning of the campus map to include new green zones planting and transplanting of trees, green routes for pedestrians and cyclists, procurement of electric and conventional bicycles, creation of a parking base and photovoltaic charging system, etc., with the aim to provide quality living, sports and recreation to all members of the community and others. The higher education institutions in Greece are trying to develop and adopt circular economy principles in their everyday operations, through initiatives such as:

---

- Waste minimization: The Greek universities have recycling programs in place for paper, plastic, and electronic waste. Some of them also encourage cycling within campus grounds.
- Energy efficiency: Universities are investing in green energy and energy-saving systems, which align with the goals of circular economy and sustainability by reducing consumption and minimizing their environmental footprint.
- Green infrastructure: Campuses also embrace circular economy practices through nature-based solutions by integrating sustainable infrastructure, such as green roofs, rainwater harvesting systems, and energy-efficient buildings.

Last but not least, the Greek HEIs are promoting and taking measures to enhance student and community engagement. The main vehicle towards student and local communities' engagement is the uptaking of initiatives which raise awareness both within the academic community and beyond it. These efforts include organizing conferences, workshops, and seminars on sustainability, nature-based solutions and circular economy, such as hackathons and innovation challenges related to circular solutions, student-led sustainability projects, i.e. organizing zero-waste events or supporting the use of shared mobility (bike-sharing programs) on campuses.

## Conclusions and Future Research

This article provided a study on the emerging field of promoting circular economy through nature-based solutions (NBS) in higher education institutions focusing on the Greek universities. It offered insights into the ways in which Higher Education Institutions develop and support effective ways for integrating circular economy and NBS in their settings. The data and information collected have been synthesized in a study that elaborated on how circular economy concepts and practices may be further strengthened through the adoption of NBS solutions in Greek universities.

The study conducted was based on desk research and data collection from Greek higher education institutions and can be further developed to include surveys and interviews with the academic community (researchers, educators, students, management) and other stakeholders which may foster the integration of circular economy through applying nature-based solutions in the Greek universities' curricula and in the campuses, as well.

There are certainly several barriers and obstacles that limit the adoption of nature-based solutions and circular economy learning in higher education. The most important challenges are the lack of appropriate state funding, the lack of knowledge and experience within the academic community, especially within educators who are not familiar with these concepts and sometimes the lack of time needed to familiarize and gain knowledge on these topics.

These challenges could be addressed by developing interdisciplinary and multidisciplinary collaboration schemes/partnerships within the academic community and by involving other external stakeholders (including government agencies, the civil society and the private sector) in the whole process. It is crucial for the achievement of sustainable development to promote integration of circular economy principles across all disciplines and university policies and nature-based solutions offer a vehicle for facilitating this integration.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

A few recommendations towards this goal could be first of all, to develop a curriculum that will be particularly designed to offer students hands-on project approach and research experience using nature-based solutions. Second, it is crucial to engage students by helping them to develop better awareness about environmental challenges, circular economy and the potential contribution of nature-based solutions. Furthermore, both educators and students need to be trained and build specific skills in order to take action towards sustainable transition and transformation of the Greek higher education institutions, by endorsing circular economy and NBS concepts. Eco-citizenship approaches in Greek academic institutions may only be promoted by fostering behavioural transformation of students, researchers, educators, professors, employees and the academic community in general. Engaging experts and academics from different fields/disciplines shall offer a new dimension of the NBS/circular economy synergy.

In conclusion there is great potential for Greek universities to serve as key players in promoting circular economy strategies, given their research capabilities, innovation culture, and position in the broader European sustainability landscape. By integrating circular economy practices, such as reusing materials or designing products for longer life cycles, with nature-based solutions, new systems are created that have the potential to regenerate both human-made and natural environments. Universities can offer their students an advanced approach in sustainability transition by exploring real world problems and promoting the Sustainable Development Goals. The outcome of this process will be building resilience and sustainability and enhancing a harmonious relationship between human activities and nature.

## Abstract

ESG reporting usually encompasses the disclosure of environmental, social and governance aspects of undertakings' business. In January 2023, the new CSRD Directive (Directive on Corporate Sustainability Reporting) entered into force, which essentially tightens non-financial reporting. The CSRD field of application has been expanded to a much larger number of undertakings and, according to estimates, it will cover approximately 55,000 companies operating in the EU internal market. Such a wide application will have great repercussions not only for EU undertaking, but also undertakings from the third countries that operate on the EU market. Following the above, this paper analyzes and examines the most significant novelties that come with the new CSRD directive and whether Croatian commercial companies (especially small and medium-sized ones) are ready for the novelties brought by the new CSRD directive. It is about changing the paradigm of corporate management and business in the EU single market, and consequently also in the Republic of Croatia. The conclusion provides an assessment of the situation and guidelines for better implementation of the new CSRD directive into the Croatian legal framework and into the corporate governance and operations of domestic companies.

**Keywords:** ESG, CSRD, non-financial reporting; circular economy; sustainable reporting.

## 1. INTRODUCTION

Nowadays, business sustainability is no longer focused only on financial but also on non-financial sustainability (Tuula, 2019; Tulla, 2020; Tuula, 2021; see also: Jovanović and

## PROCEEDINGS

---

Jovanović, 2023). In this regard, reporting on ESG, which includes: environmental (E), social (S) and governance (G) elements, is increasingly important. (Fornasari & Traversi, 2024; Brondoni & Plata, 2022; Yeaw and Seow, 2024; Raghavan, 2022).

At the international level, there are numerous examples of ESG soft laws instruments, policies and examples of good practice (see for instance so-called SDG, sustainable goals UN; Raghavan, 2022; Galant et al, 2024; Pizzi et al; 2020). In this regard, the EU is considered an international leader in ESG regulation (in this context see: Brennan, 2024; Almeyda and Darmansya, 2021; Raimo et al., 2021). Thus, as part of the EU legislative activity, the CSRD Directive came into force in January 2023, bringing significant changes to ESG reporting (Fornasari & Traversi, 202). Among other things, the innovations relate to the expansion of the field of application to small and medium-sized enterprises (SMEs), more precise reporting and standardization of ESG reports, the introduction of the concept of double materiality, etc. All of the above will have a major impact on the Croatian market, because the Republic of Croatia had to incorporate the aforementioned CSRD Directive into its legislation (Zubović, 2024).

Therefore, the following issues are posed as key research questions in this paper: are Croatian companies ready for these changes? The paper first analyzes the background and reasons for adopting the new CSRD. Then, the innovations brought by the CSRD are analyzed. The central part of the paper examines how the aforementioned changes will affect the Croatian market and whether entrepreneurs to whom the CSRD Directive applies will be able to adapt to the changes. The concluding part of the paper provides an assessment of the situation and guidelines for de lege ferenda action.

## 2. HISTORICAL DEVELOPMENT AND ORIGIN OF THE CSRD DIRECTIVE

In the 1970s, lobbying by states and international organizations for environmental protection began, with the EU positioning itself as one of the leading international leaders in promoting environmental protection, even though it was not and is not currently a significant global polluter (Sgaravatti et al, 2024). At the international level, the UN Framework Convention on Climate Change was first concluded in 1992. Then, five years later, in 1997, the Kyoto Protocol was concluded. These agreements formed the basis for the international community to conclude the Paris Agreement in 2016. This was the first legally binding agreement on this topic, which prescribed clear parameters for monitoring the signatory states with clear goals and guidelines, such as limiting the increase in global temperature, etc. (Savaresi, 2016).

All of these efforts also had an impact on EU legislation, so the Paris Agreement was the basis for the adoption of the European Green Deal. It is a document that has similar goals as the Paris Agreement with the aim of preserving nature for future generations (Staudt et al, 2023). All of the above resulted in strong legislative activity of the EU, and in the following period a large number of documents were adopted regarding the standardization of environmental protection and the expansion of the focus and concept of business from financial to non-financial business. In this context, the content of corporate reporting began to be discussed more significantly because the focus of such reporting was no longer only on profit and financial sheets (Fornasari & Traversi, 2024, p. 117; Brondoni & Plata, 2022, p. 1-2).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Generally speaking, at the international level we find various forms of corporate non-financial reporting: voluntary, mandatory and hybrid. Nowadays, the voluntary model is mostly used, i.e. a model in which reporting is not legally binding, but it is an autonomous decision of the company whether or not to report. Despite such regulation, most companies report on their operations in order to avoid reputational damage and negative effects and effects on their operations due to bad publicity. For many years, a hybrid model was in force in the EU, which as a rule obligates large companies to report on non-financial aspects of business, but large undertakings can be released from such an obligation if they explain the reasons why they do not want to report on it (Lee et al, 2023).

Directive 2014/59/EU, i.e. the Non-Financial Reporting Directive (hereinafter: NFRD) from 2014, is among the first legally binding documents that introduced the obligation to report. The field of application of the NFRD referred to large undertakings that have more than 500 employees and which are public-interest entities (Art. 19a NFRD). The mentioned undertaking was obliged to publish non-financial information from 2017 (Hummel and Jobst, 2024). NFRD tried to introduce transparency and comparative monitoring of non-financial statements among undertakings on the market. In this context, undertakings were obliged to report on various forms of non-financial business, such as a description of business methods and policies, which achieve ESG goals, then related risks and measurement of the success of such business (Koundouri et al, 2022). The main drawback when applying the NFRD was non-binding application in situations where undertakings explain the reasons why they want to hide the requested non-financial information. This led to the fact that many undertakings used the mentioned option and that the expected results of the NFRD were not realized (Cuomo et al, 2024).

The next step of the EU, in terms of non-financial reporting, was the adoption of Regulations 2019/2088 of the European Parliament and of the Council of 27 November 2019 on sustainability-related disclosures in the financial services sector (hereinafter: SFDR) which applied to participants in financial markets, including financial advisors. The SFDR introduced an obligation for the above-mentioned entities to report on non-financial risks. Also significant is Regulation (EU) 2020/852 of the European Parliament and of the Council of 18 June 2020 on the establishment of a framework to facilitate sustainable investment, and amending Regulation (EU) 2019 (hereinafter: Taxonomy Regulation; Hummel and Jobst, 2024) which introduces “the criteria for determining whether an economic activity qualifies as environmentally sustainable for the purposes of establishing the degree to which an investment is environmentally sustainable” (Art. 1. of the Taxonomy Regulation).

The EU noted that the aforementioned legal framework and hybrid model of non-financial reporting did not meet the needs of the market, i.e. that it did not achieve its set goals and purpose. Therefore, the EU adopted Directive (EU) 2022/2464 of the European Parliament and of the Council of 14 December 2022 amending Regulation (EU) No 537/2014, Directive 2004/109/EC, Directive 2006/43/EC and Directive 2013/34/EU (hereinafter: CSRD) which switched to a mandatory model of reporting on non-financial sustainability (Staudt et al, 2023; CSRD; Krueger et al, 2024).

### 3. CORPORATE SUSTAINABILITY REPORTING DIRECTIVE (CSRD)

#### 3.1. The most significant news and goals of CSRD

The increasing orientation of market participants and international organizations and countries towards environmental protection has led to the need to tighten the obligation of non-financial reporting and expand the field of application, i.e. the obligation to report also to other legal entities on the market and not only to large undertakings with public interest as prescribed in the NFRD (NFRD, Staudt et al, 2023). In other words, the NFRD referred to 11,700 undertakings, and with the adoption of the CSRD, the obligation to report was extended to 50,000 undertakings (Staudt et al, 2023; Zubović). In other words, with the new CSRD, redundant reporting is introduced and the possibility of hybrid reporting is abandoned, and instead of non-financial reporting, the term sustainable reporting is introduced (Lee et al, 2023).

The most important innovation brought by the CSRD is the concept of double materiality, which obliges undertakings to report on the effect of their operations on their business, but also on the effect of the undertaking's operations on the environment and society (Art. 19a (1) CSRD). A significant step forward is Art. 29b of the CSRD which introduces a standardized method on sustainable reporting so-called European Sustainability Reporting Standards (ESRS) developed and published by the European Financial Reporting Advisory Group (EFRAG) (Art. 29b CSRD). The aforementioned standards require detailed and clear reporting on the environmental and social aspects of business undertakings (Staudt et al, 2023). In addition, the new CSRD introduces the obligation of external audit of the sustainable report, promotes digitization and facilitates access to data through the establishment of centralized databases, risks for end users, provisions on cyber security and data protection, etc. (CSRD; Boggini, 2024).

The main goal of CSRD is most often stated to be increasing transparency and standardizing sustainable reporting. All of the above aims to facilitate access to the capital market, facilitate access to information and relevant circumstances for interested stakeholders (Birkmann et al, 2024). The goal of CSRD is, among other things, to establish a balance between all participants and shift the focus from the financial aspect of business to the impact of enterprises on the environment and society (Freeman et al, 2021).

In addition to CSRD, the EU adopted the Directive on in-depth analysis of corporate sustainability (Directive (EU) 2024/1760 of the European Parliament and of the Council of 13 June 2024 on corporate sustainability due diligence and amending Directive (EU) 2019/1937 and Regulation (EU) 2023/2859, hereinafter: CSDDD) to achieve the goals of CSRD, which entered into force on 25 July 2024 ([https://commission.europa.eu/business-economy-euro/doing-business-eu/sustainability-due-diligence-responsible-business/corporate-sustainability-due-diligence\\_en](https://commission.europa.eu/business-economy-euro/doing-business-eu/sustainability-due-diligence-responsible-business/corporate-sustainability-due-diligence_en)). Pursuant to Art. 4. of the CSDDD prescribes the obligation of member states that undertakings carry out an in-depth verification of whether the objectives in terms of conservation of ecclesiastes are achieved and whether the undertakings protect human rights. (Kent, 2023).

---

### 3.2. Deadlines and periodicity of reporting

The CSRD should be implemented into national legislation in 4 phases. The directive itself entered into force on 5.1.2023 (Zubović, 2024). The first phase concerned NFRD applicant who had to start reporting for the period from 1 January 2024 in 2025. The second phase affected all other large enterprises that were not NFRD applicant and who had to report from 1 January 2025 in 2026. The third phase concerns small and medium-sized enterprises that will have to report for the period from 1 January 2026 in 2027. The fourth phase concerns undertakings from third countries that will have to report for the period from 1 January 2028 in 2029. (CSRD; Art. 37 CSDDD, for Croatia see 70-73 Accounting Act).

## 4. IMPLEMENTATION IN NATIONAL LEGISLATION

### 4.1. General overview

The obligation to implement CSRD into national legislation was until July 6, 2024 (Zubović, 2024). Discrepancies in national legislation regarding sustainable reporting are the main obstacle to the implementation of CSRD and accompanying regulations. First of all, because the obligations of sustainable reporting in accordance with CSRD impose additional obligations and requirements for undertakings in terms of human resources, time and money (Romé and Renz, 2024). Germany stands out in the EU as one of the most advanced countries in terms of sustainable reporting (<https://www.twobirds.com/en/insights/2024/germany/neues-zur-csrd-und-deren-umsetzung-in-deutschland>). CSRD prescribes sanctions for non-compliance of sustainability reports in the form of fines or sanctions through negative market effects for non-disclosure of required information. The most severe penalties are in Germany, with the maximum sanction of 10 million euros, and in Italy they never exceed 150,000 euros. (Lee et al, 2023).

It is interesting that non-EU member states such as Norway have included CSRD provisions in their national regulations in order to harmonize them with European standards on sustainable reporting (<https://wr.no/en/news/eu-corporate-sustainability-reporting-directive-csrd-implemented-into-norwegian-law>).

In addition, other non-EU countries operating in the EU single market are harmonizing their regulations with the CSRD regulation in order to be competitors on the EU market. It is worth noting that non-EU countries often complain that the EU has a selective "neo-colloquial approach" that relates negatively to (Sgaravatti et al, 2024).

### 4.2. Implementation of CSRD Directive in Croatian Legislation

CSRD and accompanying regulations were implemented in Croatian legislation through amendments to 3 laws: the Accounting Act, the Audit Act and the Capital Market Act (Accounting Act Narodne novine 85/2024, 145/24; Audit Act Narodne novine no. 127/2017, 27/2024, 85/2024, 145/2024 and the Capital Market Act, Narodne novine No. 65/2018, 17/2020, 83/2021, 151/2022, 85/2024).

In the Accounting Act, the term sustainability is mentioned in several places: SUCH AS "a sustainability report is a report on information related to sustainability issues" (Art. 3 (8) of the Accounting Act); "the report on the verification of the sustainability report is the report as

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

regulated by the Audit Act” (Art. 3 (9) of the Accounting Act); "sustainability issues are environmental factors, social factors, factors in the field of human rights and management factors, including sustainability factors in the financial services sector" (Art. 3 (15) of the Accounting Act), and in chapter VIII that is titled as Sustainability Reporting (Art. 29 onwards of the Accounting Act). Art. 29 of the Accounting Act stipulates that large entrepreneurs, medium-sized entrepreneurs and small entrepreneurs are obliged to report on sustainability in accordance with the CRSD. (Art. 29 (2) of the Accounting Act). The sustainability report must be clearly published and contain a brief description of the implementation of the entrepreneur's sustainability strategy (Art. 29 (3) and (4) of the Accounting Act).

Furthermore, the law prescribes the criteria for exemption from submitting a sustainability report (Art. 31 of the Accounting Act), and what a consolidated sustainability report looks like (Art. 32 of the Accounting Act). and exemption from submitting a consolidated sustainability report (Art. 33 of the Accounting Act). Art. 33 of the Accounting Act stipulates that the members of the management, executive directors and the management board of the entrepreneur are obliged to report to the representatives of the workers on certain aspects of sustainability.

In Art. 35 of the Accounting Act prescribes the content of sustainability reports for non-EU countries.

In Art. 36 of the Accounting Act stipulates that the aforementioned sustainability reports are compiled and presented using the European sustainability reporting standards, as regulated by the implementing acts of the European Commission. Also, the Accounting Act in the Art 37 prescribes the obligation to verify, or draw a conclusion on the sustainability report by an independent auditor or an auditing company that performs a statutory audit of annual financial statements or annual consolidated financial statements.

Provisions 70-73 of the Accounting Act are also very important, which talk about the deadlines for mandatory submission of sustainability reports for large, medium and small enterprises and for enterprises from third countries (Art. 70-73 of the Accounting Act). The mentioned deadlines overlap with the deadlines from CSRD.

In the revision law, Art. 4. of the Audit Act stipulates that audit services include, among other things, verification of sustainability reports (Art. 4(1) of the Audit Act). Then it is prescribed that the verification of the sustainability report is actually the verification of the sustainability report and the consolidated sustainability report, which includes the implementation of procedures resulting in the conclusion given by the audit company. in accordance with this Law and the law regulating the accounting of entrepreneurs (Art. 4(6) of the Audit Act).

## 5. ISSUES REKATED TO ESG POLICY IMPLEMENTATION AND TRENDS

Despite all the positive aspects of sustainable reporting, numerous authors and practitioners warn of the increasingly frequent false reporting of sustainability. In this context, the most mentioned is greenwashing, which represents the false presentation of action of undertakings as sustainable. Reasons for using greenwashing can be gaining a false green reputation and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

attracting customers, as well as deceiving business partners, financiers, etc. (Gatti et al, 2019; De Freitas Neto; Cornell and Damodaran, 2020).

In addition to the above, numerous authors criticize sustainable reporting, stating that orientation towards sustainability does not necessarily bring better business results. Namely, the authors warn that sustainability is manifested in long-term strategies and that large investments of money and resources are needed, and that the real results of the application of business viability and normative inconsistency (Johnson, 2021). New trends bring facilitation of reporting on sustainability through the use of AI softwares that facilitate the monitoring of sustainability indicators and parameters (Saxena et al, 2022; Sætra, 2023).

## 6. CONCLUSION

CSRD introduced major changes in the EU single market. The aforementioned Directive expanded the field of application from non-financial reporting to sustainability reporting, and expanded the scope of sustainability reporting obligations to include all other large, medium and small entrepreneurs, as well as entrepreneurs from third countries. Also, the concept of double materiality has been introduced, which must be reported not only on the impact of operations on undertakings, but also on the impact of undertakings on the environment and society in general.

All the mentioned provisions must be implemented in national legislation in four stages. The implementation this time affects not only EU member states, but also third countries operating in the EU. This has great implications for the day-to-day operations of undertakings, because now they have to calculate and measure sustainability parameters in their operations.

The Republic of Croatia also implemented CSRD. Implementation was carried out mostly through amendments to the Accounting Act, Audit Act and Act on Capital Market. All the mentioned regulations are harmonized with the EU legislation. At this moment, it is too early to assess whether the correct application has taken root properly in the Croatian business market. It can only be said that there are numerous dangers and negative effects of sustainable reporting. For example, greenwashing, excessive investments and weak investment returns, and the constant need for up-to-date compliance in order to facilitate the monitoring of sustainability parameters and indicators and at the same time facilitate ESG reporting.

It remains to be seen how sustainability policy and regulation will develop in the light of current global politics and international trade, and for now we can only hope that the pipe default CRSD will have a positive impact on the EU market.

### **Abstract**

This paper explores the interdependencies among key circular economy (CE) indicators across the European Union using data from the EUROSTAT Monitoring Framework. The dataset spans the years 2012–2021 and includes information from 27 EU member states, covering thematic areas such as production and consumption, competitiveness and innovation, and global sustainability and resilience. A Bayesian network is employed to learn the probabilistic structure among seven selected indicators, revealing conditional relationships that characterize the dynamics of the EU’s circular economy. Scenario analysis shows that increased consumption levels are associated with higher material use and waste generation, alongside a notable rise in patent activity related to recycling—suggesting that environmental pressure may stimulate innovation. These findings highlight the value of understanding indicator interdependencies to support evidence-based policymaking and guide the EU’s transition toward a more circular and resilient economy.

**Key words:** Circular Economy, Bayesian networks, Probabilistic dependency, CE indicators, EUROSTAT, European Union

### **Introduction**

The EU’s aim to achieve a circular economy over a linear one requires transformative actions targeting countries’ policy frameworks, governance structures, and operational practices. These actions must prioritize sustainability, resource efficiency, and innovation across all sectors. Key steps include implementing regulations to support circular business models, enhancing local government capacities for waste management and recycling, and fostering public-private partnerships for sustainable development. However, these actions depend heavily on the economic resilience of the participating countries which in turn depend on the continuous availability of resources for production. This challenge underscores a long-overlooked truth: humanity has only recently come to fully recognize that natural resources are, in fact, finite.

The concept of the circular economy (CE) originated from Boulding’s (1966) call for a shift from unlimited resource use to a closed-loop system, recognizing the planet’s finite resources. Pearce and Turner (1989) later formalized this idea by introducing the term “circular economy,” promoting a circular model over a traditional linear one to enhance economic resilience. Since then, as pointed out by Cinicioglu and Korkmaz Tümer (2024)

## PROCEEDINGS

---

interest in CE has grown significantly. On that, Merli *et al.* (2018) document the rise in CE-related publications and offer a comprehensive review of the field. Much of this research has been concentrated in Europe and China, where CE has been adopted as public policy. Europe has advanced the agenda through frameworks like the European Green Deal (European Commission, 2019), while China embedded CE into national laws such as the Circular Economy Promotion Law. Winans *et al.* (2017) emphasize the importance of supportive policies for standardized recycling to encourage industry adoption.

This paper explores the probabilistic dependency structure of EU member states using datasets from the EUROSTAT database, focusing on production & consumption, competitiveness& innovation and global sustainability & resilience. To analyze these relationships, the study employs Bayesian networks, a powerful probabilistic graphical modeling tool that reveals conditional dependencies among the set of selected circular economy indicators. The insights gained from this approach will shed light on the interplay between resource dependency, self-sufficiency, and eco-innovation, offering valuable implications for policymaking and institutional reforms necessary for achieving a circular economy.

The remainder of this paper is structured as follows: In the next section, we present our methodology which will be used as the main tool of our analysis. This is followed by an introduction to the set of indicators obtained from Eurostat database, along with a description of the data cleaning procedures applied on the data set. The subsequent section is devoted on the construction of the Bayesian network and the analysis conducted on it. This includes an exploration of the dependency structure, as well as scenario analysis on it, which provides insights into the interdependencies among EU countries with respect to the circularity indicators. Finally, we conclude the paper by summarizing the key findings and implications.

### Methodology: Bayesian Networks

Bayesian networks are acyclic probabilistic graphical networks in which variables are represented through nodes and the probabilistic dependencies between the variables are represented through directed arcs. In a Bayesian network (BN) if there is an arc between two variables then the variable from which the arc is pointed is called as the parent variable of the node to which the arc is pointed. Each variable in a Bayesian network  $X_1, \dots, X_N$  follows a probability distribution conditioned on its parent variables and the joint probability distribution of the network is formed by the product of these conditional probability distributions as it is shown in Equation 1 below. Each variable in a Bayesian network is conditionally independent given its parents.

$$P(X_1, \dots, X_N) = \prod_{i=1}^N P(X_i | Pa(X_i)) \quad (1)$$

Below in Figure 1 a small Bayesian network with four variables  $X_1, X_2, X_3$  and  $X_4$  which follow the probability distributions  $P(X_1)$ ,  $P(X_2 | X_1)$ ,  $P(X_4 | X_1)$  and  $P(X_3 | X_2)$  are represented. In this small Bayesian network  $X_1$  is the parent variable of  $X_2$  and  $X_4$ ,  $X_3$  is the child variable of  $X_2$  and  $X_4$  is the child variable of  $X_1$ . Notice that in the small BN  $X_1$  stands without any parents with its marginal distribution and therefore is called as to root variable of the network. In BNs

there is no limit regarding the parent variables and children that a variable can take. Once an observation(s) for the state(s) of the variables is observed, the BN is updated accordingly, representing the posterior probabilities of the variables in the network. As represented in Figure 1 given below the variables  $X_3$  and  $X_4$  do not possess any children. One of the most important advantages of Bayesian network is that it allows us to use the backpropagation algorithm which ensures that an observation downstream in the network will result in an updating process upstream in the network.

**Figure 1. A Bayesian network representation with four variables**

The chain rule that is represented in Equation 1 ensures that Bayesian networks are acyclic graphical networks in the sense that if you follow the direction of arcs beginning from one node you cannot close the cycle and cannot end up in your starting node. Another aspect regarding the Bayesian network is that it possesses two different layers, one is the graphical network structure which is represented through the graph and the other is the computational background where the conditional probability distributions of the variables are represented which constitute the parameters of the variables. Consequently, the inference process in Bayesian networks relies on continual application of the Bayesian updating rule. The graphical interface of Bayesian network provides an intuitive appeal and understanding to the audience outside the field and the computational background and inference process ensures the correct demonstration of the joint probability distribution represented by the set of variables in the network.

Bayesian networks are first introduced by Pearl (1985) which later became an important part of artificial intelligence, and its use spread to many different application areas from healthcare, risk assessment, medicine, targeted advertising, competitiveness and innovation, finance, Maritime industry and numerous more. Some examples are as follows: Cinicioglu *et al.* (2024) provide a benchmark procedure for the evaluation of the sovereign risk of countries using Bayesian networks which involves a comprehensive analysis involving several steps conducted comprehensive analysis involving conducted on the BNs for each of the 3-month intervals of the COVID-19 pandemic. Their study illustrates the use of artificial intelligence methods to understand the working mechanism of economic systems. Kyrimi *et al.* (2025) advocate the use of BNs as a healthcare governance tool since it allows for counterfactual reasoning which can be used to assess what would have happened if treatments other than those occurred has been selected. Animah *et al.* (2024) provides a comprehensive literature

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

review on Bayesian network applications in maritime industry emphasizing that uncertainty-related tasks such as accident investigation, reliability prediction and port sustainability are key priorities of the industry, making Bayesian networks a convenient and reliable method for analysis. Cinicioglu *et al.* (2017) explores the interaction between competitiveness and innovation using Bayesian networks and Cinicioglu *et al.* (2012) analyses the competitiveness of automotive industry using Bayesian networks.

As demonstrated, there exists a broad range of application areas for the use of Bayesian networks. This wide variety exemplified above can be further expanded to include even more domains. The reasons are as follows: The intuitive appeal of Bayesian networks makes it a convenient tool accessible to a wider audience. Additionally, their strong computational foundation and ability to update in light of new evidence allow for accurate inference. Moreover, scenario analysis conducted on Bayesian networks enables the researcher to explore the answers of what-if questions, drawing insights from the updated network after incorporating new evidence(s). Another key advantage is their ability to represent and explore multiple input and output variables, unlike regression analysis, which is limited to a single output variable. This capability significantly enhances their prediction power. Lastly, Bayesian networks support counterfactual reasoning and backward propagation further strengthening their analytical and decision-making capabilities. In the following section, we describe the data set obtained from the EUROSTAT database which will be used for learning the Bayesian network for analysis.

### **Data Set: EU Circularity Indicators**

The Circular economy Action plan was launched in 2020 as a key initiative under the European Green Deal and its goal is set as to transform the EU into a leader in sustainability and resource efficiency. The European Commission’s Monitoring Framework, designed to keep track toward a circular economy, collects data of European countries across five thematic sections of production & consumption, waste management, secondary raw materials, competitiveness and innovation and global sustainability and resilience. These thematic sections encompass a total of eleven statistical indicators, some of which also feature sub-indicators. Seven different sub indicators from the EUROSTAT database are selected in this work to infer the probabilistic dependency structure in EU regarding the selected circularity indicators. For that purpose, using the data set obtained from EUROSTAT database between the years of 2012-2021 containing the data of 27 European countries the corresponding Bayesian network will be learned. The list of the countries is provided in Table 1 below which were selected on the basis of availability of data for the time frame considered. The list of the sub indicators selected for analysis are provided in Table 2 following along with their codes as used in the EUROSTAT database.

According to the EUROSTAT database, the set of variables used for this study are defined as follows:

**Material Footprint (pc020):** This indicator measures the global demand for raw materials (biomass, metal ores, non-metallic minerals, and fossil energy materials) that results

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

from consumption and investments by households, governments, and businesses within the EU.

**Generation of Plastic Packaging Waste per Capita (pc050):** This indicator tracks the amount of plastic waste produced per person, specifically focusing on packaging materials. Packaging, in this context, refers to any material used to contain, protect, handle, deliver, or present goods throughout their lifecycle, from raw material to consumer. It also includes non-returnable packaging items.

**Private Investment and Gross Added Value Related to Circular Economy Sectors (cie012):** This indicator assesses the financial investments and value added by private sectors that are directly involved in circular economy activities. It reflects the economic contributions from industries focused on sustainability, recycling, and the reuse of materials.

**Patents Related to Recycling and Secondary Raw Materials (cie\_020):** This indicator counts the number of patents issued that are related to recycling technologies and secondary raw materials. These patents are categorized using the Cooperative Patent Classification (CPC), focusing on innovations that improve recycling processes or create new uses for secondary raw materials.

**Consumption Footprint (cei\_gsr\_010):** The consumption footprint measures the environmental impacts of consumption in the EU and its member states. It combines data on how intensely products are consumed with the environmental effects of producing these goods, helping to assess the overall sustainability of consumption patterns.

**Material Import Dependency (cei\_gsr\_030):** This indicator calculates the EU's reliance on imported materials by comparing the volume of material imports to direct material inputs (DMI). It is expressed as a percentage, highlighting how much the EU depends on external sources for its raw materials.

The data set obtained from EUROSTAT database constitutes 10 years of annual data for the twenty seven countries listed in Table 1. This data set is transformed into a form where a country's data for each year corresponds to a line, resulting in 270 observations for the seven variables given in Table 2. Since the variables used in this study use different range of values all the variables are discretized using hierarchical discretization technique. Hierarchical discretization is an unsupervised method that begins with one bin per record and merges bins with the smallest mean differences until the desired number of states is reached (Cinicioglu *et al.*, 2024). Accordingly, each variable is discretized with five states where the state beginning *s1\_* refers to the lowest values for that variable and the state beginning as *s5* refers to the state referring to the highest values of that variable. In the following section the discretized data set will be utilized for learning the BN.

### Bayesian Network Analysis:

#### *Exploring Dependency Structures via Bayesian Network*

Using the discretized data set described in the previous section we will learn the corresponding Bayesian network demonstrating the dependency structure between the circular economy indicators selected. For learning the structure of the Bayesian network from the data, Bayesian search algorithm is employed which uses the hill-climbing structure with random

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

starts. The Bayesian search algorithm identifies the most probable Bayesian Network (BN) structure  $G$  given the data  $D$  by maximizing the log-likelihood scoring function shown below. In this context,  $n$  denotes the number of variables in the BN,  $q_i$  represents the number of configurations of the  $i$ th variable's parent set, and  $r_i$  indicates the number of categories (or states) of the  $i$ th variable (Bouckaert, 1995). The terms  $N_{ijk}$  and  $N_{ij}$  correspond to the number of instances in the dataset  $D$ , where  $N_{ij}$  is the marginal count over the states  $k$  of the variable.

$$LL(G|D) = \sum_{i=1}^n \sum_{j=1}^{q_i} \sum_{k=1}^{r_i} N_{ijk} \log \left( \frac{N_{ijk}}{N_{ij}} \right) \quad (2)$$

Once the structure learning of the Bayesian Network (BN) is completed, the parameters of the variables are estimated using the Expectation-Maximization (EM) algorithm (Dempster *et al.*, 1977; Lauritzen, 1995). This algorithm follows an iterative process to estimate the conditional probability tables of the variables, aiming to maximize the likelihood of the observed data given the network model.

Figure 2 below illustrates the Bayesian network structure learned directly from the dataset. Each node in the network represents a variable, and alongside these nodes, marginal probabilities for each distinct state are displayed, providing clear insight into the distribution and trends of each variable across the data. For example, consider the node labeled "Patents related to Recycling," which reflects the annual count of patents filed per million inhabitants in relation to waste management and recycling technologies. Observing the probabilities, we note that state  $s_1$ , representing the lowest category (below a value of 1), holds a substantial marginal probability of 83%. This significant finding indicates that, across most European countries examined during the ten-year span covered by the data, innovation and patent activity in recycling-related technologies remain strikingly limited. Given the context where a higher number of patents would indicate more robust innovative efforts and potential advancement towards circular economy goals, the observed concentration in the lowest patent state clearly highlights a notable gap in scientific and technological developments. Consequently, this analysis reveals a somewhat concerning stagnation in research outputs and innovation, suggesting that the current trajectory of scientific effort dedicated to advancing circular economy practices may not yet be sufficient to meet the ambitious targets envisioned by policy frameworks and sustainability initiatives.

Moreover, as illustrated in Figure 2 below, which shows the Bayesian network structure learned from the data, we observe a direct dependency between “Material import dependency” and both “Material footprint” and “Plastic packaging per capita”. Specifically, “Material import dependency” acts as a parent node to the other two variables. While in a Bayesian network the use of the chain rule and the assumption of conditional independence allows the influence of a variable to extend beyond its immediate children, the presence of an arc between two nodes always indicates a strong dependency structure. In this case, the arcs from “Material import dependency” to the other two variables confirm a substantial direct influence. More generally, wherever an arc is present between two variables in the network, it signals that a significant statistical dependency exists between them.

Another noteworthy observation concerns the variable “Consumption footprint,” which measures the sustainability of consumption by combining product use intensity with the environmental impact of production across EU member states. As illustrated in Figure 2, the marginal probabilities associated with this variable reveal a high degree of variation across its different states, encompassing low, medium, and high consumption profiles. This pattern stands in contrast to most other variables in the Bayesian network, which tend to exhibit one or two dominant states characterized by significantly higher marginal probabilities. Notably, two other variables—“Material import dependency” and “Private investment in the Circular Economy”—also exhibit broader variation across states, though less pronounced than that of “Consumption footprint.” This wider distribution suggests diverse structural conditions and policy environments across EU countries, as well as significant heterogeneity in consumption-related environmental pressures. It also reflects the longitudinal nature of the dataset, which spans a 10-year period during which consumption patterns and related indicators may have shifted considerably. In the following subsection scenario analysis will be conducted which will further shed light in the dependency structure and explain how the realization of different scenarios is changing our inferences regarding the set of variables.

**Figure 2. The Bayesian network structure showing the probabilistic dependencies and marginal probabilities of the variables**

### *Scenario Analysis*

As the next step in our analysis, we apply the evidence propagation functionality of Bayesian networks to perform scenario analysis. This approach involves setting one or more variables to a specific state—effectively assigning a probability of 1 to that state—and then examining how this observation influences the posterior probabilities of other variables throughout the network.

In Figure 3, the variable “Consumption footprint per inhabitant” is observed in its fifth state  $s_5$ , representing the highest level of consumption. By comparing the updated posterior marginal probabilities in Figure 3 with the baseline probabilities presented in Figure 2 (prior to the evidence), we observe a substantial increase in the likelihood of higher states for both “Plastic packaging waste per capita” and “Material footprint.” This result aligns with expectations: as consumption intensifies, both plastic waste generation and material usage tend to rise accordingly.

However, more nuanced insights emerge when examining the response of two other variables—“Material import dependency” and “Patents related to recycling.” Following the observation of high consumption ( $s_5$ ), the posterior probabilities for both variables shift towards higher states. This suggests a potential causal chain where increased consumption leads to greater reliance on imported materials, likely due to the depletion or insufficiency of domestic resources. Simultaneously, the rise in the state associated with patent activity implies that as environmental pressure from consumption intensifies, greater scientific and technological efforts are directed toward recycling and waste management solutions.

It is important to note, however, that this observed relationship might also reflect structural patterns in which countries with the highest consumption levels are concurrently those investing the most in circular economy research and innovation. Therefore, while the scenario analysis supports intuitive dependencies, it also highlights the potential influence of underlying economic and policy environments that shape both consumption behavior and CE-related advancements.

## PROCEEDINGS

**Figure 3. The updated BN after observing the evidence for  $P$  (Consumption footprint per inhabitant = s5|Material Import Dependency)**

As the next step of the analysis, we extend our investigation by incorporating additional evidence: namely, that “Plastic packaging generation per capita” is in its fifth state ( $s5$ ), representing the highest level of plastic packaging use which is represented in Figure 4 below. At this stage, both observations—“Consumption Footprint per inhabitant” and “Plastic packaging generation per capita”—are simultaneously set to their fifth state ( $s5$ ), indicating the highest levels for each. Upon entering this evidence, the updated posterior probabilities in the Bayesian network reveal slight improvements in the probabilities of higher-value states for the variables “Patents related to CE” and “Gross value-added CE”. These two indicators reflect positive developments in the context of the circular economy, where higher values represent a more favorable position. Consequently, one may interpret this result to suggest that increased environmental waste can potentially trigger a counter-response by accelerating progress toward circular economy solutions. As represented through these scenario analyses conducted Bayesian networks represent a favorable tool in terms of the policy analyses. In the following section, we summarize our research and conclude.

**Figure 4. The updated BN after observing the evidences for  $P$  (Consumption footprint per inhabitant = s5|Material Import Dependency) &  $P$  (Plastic packaging generation per capita= s5 |Material Import Dependency, Consumption footprint per inhabitant = s5)**

## Conclusions

The fast depletion of natural resources and the substantial increase in the amount of waste generated over the years is the result of the reckless consumption pattern that humankind has followed over the last century. As a response to the resource-intensive and environmentally harmful patterns of consumption and production, the circular economy has emerged as a significant and rapidly growing concept. Launched alongside the 2015 UN Agenda for Sustainable Development, the EU’s Circular Economy Action Plan and European Green Deal aim to promote sustainable growth, improve resource efficiency, and reach climate neutrality by 2050. On the other hand, for impactful consideration and implementation of circular economy, it is important to apply the right set of Circular economy indicators to assess the current state and guide progress effectively. Moreover, it is also very important to observe the dependency structure between the set of CE indicators used for identification purposes. Understanding how changes in one or more circular economy (CE) indicators affect others is essential for effective policy analysis and responsible legislation. In this study, we use seven CE indicators from the EU Monitoring Framework published by Eurostat, covering the thematic areas of production and consumption, competitiveness and innovation, and global sustainability and resilience. Our analysis shows that “Consumption footprint” varies significantly across EU countries, reflecting diverse environmental pressures. Scenario analysis reveals that higher consumption levels increase plastic waste, material use, and

## PROCEEDINGS

---

import dependency, while also correlating with greater innovation in recycling. These findings suggest that rising environmental impact may drive circular economy advancements, highlighting the value of Bayesian networks for policy analysis.

## Abstract

Conscious consumers prefer green products and actively seek information about companies' circular practices. Demonstrating the role of consumers as key drivers of sustainable consumption is crucial for adequate supply chain management. Different industry branches have different potential for the application of circular processes such as reducing, reusing, and repairing. The paper is based on critical reviews of the relevant literature and aims to emphasize the biggest strengths and benefits for organizations from implementing circular strategies from the consumer's point of view. In this regard, effective transitioning towards sustainable supply chains involves tackling greenwashing. Therefore, it is important to understand to what extent industries are using greenwashing to mislead their stakeholders in the supply chain. It was possible to identify possible solutions to prevent greenwashing across four main dimensions: consumers, relationships between companies and suppliers, certification programs and reporting assessment; and corporate leadership. Due to the significance and validity of the research, the paper highlights the impact of sustainable consumption on the development of greenwashing practices.

**Keywords:** Circular economy, Customers behavior, Sustainability, Greenwashing, Industry sector, Informational asymmetry

## Introduction

There is growth of the production and consumption of circular products. However, greenwashing is a marketing practice of presenting products as environmentally responsible without reasons, which can influence consumer perceptions and attitudes toward the consumption of circular products. In this regard, greenwashing tactics can increase consumer confusion. In the field of sustainability, circular consumption and greenwashing have gained significant attention. The recent study by the European Commission (2022) revealed that 80%

## PROCEEDINGS

---

of online shops, web pages, and advertisements searched contained green claims such as “green” or “friendly to nature”, of which 55.45% were implicit (images, design, color suggesting environmental benefits), 35% were explicit (logos and labels), and about 21% were vague or general environmental claims.

By supporting sustainable businesses and circular consumption, consumers can proactively create more sustainable society. Understanding consumer attitudes to sustainability and sustainable behaviors is a major driver of changing consumer behavior. Despite consumers’ willingness to make decisions with sustainability and the environment in mind, consumers often make a trade-off between managing higher prices and making sustainable lifestyle choices. Consumer spending accounts for over a quarter of all emissions and it is the single largest contributor to total greenhouse gas emissions. Some of the consumers most valued sustainable or ethical practices are producing sustainable packaging and products; Reducing waste in manufacturing processes; Committing to ethical working practices; Respect for human rights; Reducing carbon footprint. Some of the main reasons for not adopting a more sustainable lifestyle are high costs, a lack of interest in sustainability, and not having enough information (Deloitte, 2025).

First, this paper contributes to the literature on greenwashing by empirically examining how consumers’ perceptions of greenwashing affect circular economy practices. While most previous research has predominantly focused on corporate behavior, this paper is focused to individual consumer perceptions and behaviors, thereby filling research gap. In this regard, accelerating the transition to a circular economy is a policy priority in Europe. With a circularity rate of 11.8% in 2023, Europe consumers have higher proportion of recycled materials than other world regions. Monitoring the circular economy involves tracking material flows environmental degradation. Undertakings and consumers are showing early signs of adopting new business models and consumption patterns, but linear business models continue to prevail (European Environment Agency, 2024). To reduce waste and maximize resource use, circular consumption involves strategies including repairing, recycling, and reusing. On the other hand, greenwashing refers to the practice of businesses using exaggerated or misleading environmental claims to take advantage of customers’ growing environmental concerns. Green consumerism is now a politically and economically acceptable and ecologically benign presumption. However, the rise of greenwashing techniques is causing many to question the veracity of businesses’ environmental promises (Lopes, Gomes, & Trancoso, 2023).

In according to the main purpose of the paper, paper is organized in the next interconnected sections. Besides Introduction, the second section is devoted to literature review, the third section is related to research results and discussion about the consumer behavior in environmental issues and circular economy. The last section gives concluding remarks and policy recommendations which can ensure adequate regulation in this area.

### Literature review

There is several monitoring frameworks currently focused on Europe’s circular economy, including the European Commission’s Circular Economy Monitoring Framework (CEMF) which provides effective understanding of macrophenomena (Eurostat). On one hand,

knowledge creation and innovation are essential pillars to support circularity, so in 2023, almost 4000 scientific articles were published related to circular economy. This shows a growing level of research and innovation activity for circularity (European Environment Agency, 2024). Some studies investigate whether the phenomenon of environmental, social, and governance (ESG) issues has given rise to a new form of greenwashing in a broad sense, not limited to the environmental sphere, but also extended to social and governance issues. Whether companies engaged in the transition to sustainable and to circular models are actually focusing on concrete sustainable actions and less on distorted communication (Todaro, & Torelli, 2024).

On the other hand, a growing number of consumers are choosing sustainable solutions as environmental awareness grows. Due to this change in customer behavior, marketing and advertising campaigns that highlight how goods and services affect the environment have increased. But not all sustainability claims are as truthful as they appear.

According to a 2020 European Commission investigation, 42% of online environmental claims were either misleading, inflated, or overstated (Carbon Train, 2024).

Environmentalist Jay Westerveld coined the phrase "greenwashing" in 1986 to describe a deceptive practice employed by undertakings to make their goods or services appear more environmentally friendly than they are. This is accomplished by using deceptive marketing techniques to appeal to customers who care about the environment. Therefore, greenwashing is a tactic used by undertakings to profit from the growing demand for eco-friendly goods. Greenwashing also happens when businesses highlight a product's sustainable features to draw attention away from their involvement in ecologically harmful activities. Greenwashing, fake green marketing, or eco-manipulation are terms that refer to the act of making exaggerated or false claims about the environmental benefits of a product or service (Savić, & Frfulanović, 2024). Greenwashing activities use information asymmetry and misleading buyers (Jakubczak & Gotowska, 2018).

There are several examples of greenwashing used by undertakings to encourage the consumption, such as (a) powerful images that companies use related to ecology and nature to convey that they are responsible and environmentally aware; (b) misleading labels claiming that products have environmental benefits; (c) certifications that do not exist on how the products are natural and sustainable; (d) red herrings to try to divert consumers' attention, highlighting aspects of the products as ethical and sustainable; and (e) approximate terminology with self-denomination by companies that their products are green (Safdie, 2023). Figure 1 shows different forms of greenwashing which are most found in industrial practice. It can be product oriented, process oriented, image oriented or can emphasize the environmental facts or combination of the mentioned phenomena.

Figure 1. Types of greenwashing

Source: Authors illustration

Two different major classifications of greenwashing: Claim greenwashing and Executional greenwashing. Figure 2 shows the main classifications in the phenomenon of greenwashing.

Figure 2. levels of greenwashing implementation

Source: de Freitas Netto, S. V., Sobral, M. F. F., Ribeiro, A. R. B., & Soares, G. R. D. L. (2020). Concepts and forms of greenwashing: A systematic review. *Environmental Sciences Europe*, 32, 1-12.

Greenwashing refers to the practice of falsely promoting an organization’s environmental efforts or spending more resources to promote the organization as green than are spent to actually engage in environmentally sound practices. Recent researches show what extent greenwashing may endanger the industry in addressing challenges related to the implementation of more sustainable circular economy in the context of designing with intention of recycle, reduction of by-products, lower energy consumption, and wise purchase

---

habits (Adamkiewicz, Kochańska, Adamkiewicz, & Łukasik, 2022). In other words, greenwashing is based on highlighting one good practice. Some studies on the consumption theory showed that there is a strong relation between consumption values and the green trust. Eco-labeling influenced the consumer perception as a mark of superior quality, higher value, and an indicator of a lifestyle (Zaidi, et al. 2019).

Greenwashing is more likely in the sectors of consumer staples, energy, industrial, information technology, materials, and utilities, all which impact environmentally sensitive areas. Greenwashing firms have a lower-weighted average cost of capital due to a higher debt-to-capital ratio. They are larger, have higher institutional ownership, and lower dividend yields. On the other hand, greenwashing firms have more ESG-related controversies that can hurt firm revenues and market value, they have higher unsystematic risk, and they have lower dividend yields and return on equity (Gregory, 2024). In greenwashing, there is a complicated link between customer intentions and behavior. Greenwashing positively affects consumers' environmental concerns and their propensity to seek sustainable information. These positively impact consumer intentions toward circular consumption. The findings challenge the traditionally negative perception of greenwashing, suggesting its paradoxical contribution to promoting sustainability. Insights into consumer behavior related to sustainability has practical implications for policymakers in shaping effective circular economy strategies (Lopes, Gomes, & Trancoso, 2023). Some authors outline the predicted effects of greenwashing on green consumer confusion, green perceived risk, and green trust. Decrease in greenwashing and an increase in green initiatives and more transparent marketing are definitively beneficial to promote the customers' green trust. Green marketing is more efficient and can encourage green consumption (Adamkiewicz, Kochańska, Adamkiewicz, & Łukasik, 2022).

Greenwashing poses a significant obstacle to consumer intentions. When perceived, it decreases purchase intention and creates a discrepancy between what customers intend to do and what they do. Greenwashing hurts consumers who care about the environment and are willing to pay more for goods (Testa, et al. 2021), whereas the suppliers who sell the goods don't honestly address how the items affect the environment (Apaolaza, et al. 2023). Although consumers' determination to combat greenwashing has grown, the results have been unclear (Rotkirch, & Lenk, 2021). Greenwashing can have negative effects on both consumers and the environment, as it can lead to confusion and mistrust among consumers and encourage the production and consumption of products that are not sustainable. It is important for consumers to be aware of greenwashing and to look for evidence to support companies' environmental claims. Additionally, undertakings can take steps to be more transparent and honest in their ecological claims, build consumer trust, and promote truly sustainable practices (Savić, & Frfulanović, 2024).

Numerous studies analyze the direct and indirect practices of greenwashing in the fashion industry and its impact on consumers and highlight the existence of greenwashing in the industry's supply and consumption chain. Greenwashing has a disruptive impact on the fashion industry's supply chain. Some undertake resort to greenwashing by promoting a green image without making substantial environmental or social changes. Therefore, transparency and honesty in the industry's green marketing strategies is *conditio sine qua non* (Badhwar, et al. 2024). Braga, et al. (2019) found that when greenwashing is recognized in a product, its

## PROCEEDINGS

---

aspects of loyalty, satisfaction, and benefits are lost, and it becomes a product that causes confusion in the consumption of it. Bulut et al. (2021), show that the perception of greenwashing diminishes the effects of environmental concern on green behavior., while Zhang et al. (2018), claim that the perception of greenwashing has a direct negative effect on green purchasing intent.

### Research results and discussion

Some of the main motivations for greenwashing are: attracting eco-conscious consumers, enhancing brand image, competitive advantage which can lead to customer loyalty and increased market share, meeting regulatory and investor expectations, cost savings due to greenwashing, companies get an image of being environmentally conscious without any costs for implementing real environmental change, and mitigating negative publicity. Greenwashing occurs in a variety of sectors:

- Greenwashing, as used in the automotive industry, is the practice of deceiving consumers about the environmental benefits of cars by inflating efficiency or reducing environmental effect in marketing campaigns.
- When businesses significantly rely on fossil fuels while claiming to be ecologically benign by employing renewable energy sources, this is known as "greenwashing" in the energy sector.
- In the food industry, greenwashing refers to companies making misleading claims about their products, while ignoring sustainability issues in their supply chain. Single-use plastic is not sustainable due to it cannot be recycled 100%, and recycling can never make up for the volume of plastic produced.
- Greenwashing in fashion takes place when brands assert unfounded statements about the eco-friendliness of their clothing collections or methods, disregarding the environmental consequences of fast fashion and inadequate labor practices.
- Certain furniture companies practice greenwashing by misleadingly advertising the environmental advantages of their products, such as asserting the use of sustainable materials or techniques.
- In the banking sector, greenwashing happens when financial institutions promote "green" financial offerings or sustainability efforts while simultaneously funding industries that negatively impact the environment.

Monitoring changes in material flows and waste generation and management is key to assessing the impact that the circular economy has on the environment and consumer behavior. Figure 1 outlines the trends among EU citizens in environmental and circular economy efforts in Europe: the EU's material footprint, waste generation, recycling of total waste and the circular use of materials.

Figure 1. Trends among European union consumer behavior in environmental issues and circular economy

Source: European Environment Agency (2024). Available at:

<https://www.eea.europa.eu/en/analysis/publications/europes-circular-economy-in-facts>,

Accessed on: 20<sup>th</sup> January 2025.

The material footprint reflects the resources needed to produce the goods and services Europeans consume. It stood at 14.1 tons per capita in 2023 while waste generation was at 5 tons in 2022. The results suggest that high numbers stem from an unsustainable use of resources. If the world consumes resources at the level of the EU, the capacity of the planet to provide these resources will be exceeded. On the other hand, resource productivity in the EU is increasing in 2022, for every kilogram of material consumed in the EU economy, 2.1€/kg worth of production activity was generated. This is more than 2.5 times the global average. The material footprint does not show dramatic changes over time so it can be concluded that circularity has not yet taken off. On the other hand, in the period from 2010 to 2023, the EU economy grew, meaning that we were able to produce more with a stable material input. If major mineral waste is excluded, the EU landfills only 306kg per person annually (2022) and it recycles almost half of the waste it generates. However, recycling is not enough to establish

## PROCEEDINGS

---

circularity in Europe. Functional secondary markets are required so that secondary materials find their way back into manufacturing, thus offsetting primary resources.

Data supplied by all stakeholders in the recycling value chain needs to be trustworthy and validated to address the life cycle of waste generation, prevent contamination of recycled materials by hazardous substances, and protect recycling operations from legal risks, financial losses and reputational damage. Transparency in waste data is also a powerful tool against greenwashing (The [Global Waste Management Outlook 2024](#)). Moral hazard in greenwashing is exacerbated by the lack of stringent regulatory frameworks and enforcement mechanisms. When companies realize that the penalties for being caught are minimal or non-existent, they are emboldened to make false or exaggerated environmental claims. This behavior not only damages the reputation of individual brands but also erodes the credibility of the entire organic product industry (Srisathan, & Naruetharadhol, 2025). According to certain studies, a company's market power may be diminished if regulators uncover greenwashing and it becomes widely known.

### Conclusion and policy recommendations

Customers should be educated in how to recognize greenwashing so that they can make informed decisions. Businesses that engage in greenwashing leverage the attitudes of customers who are fostering green consumption. The lack of information of consumers favors the development of disinformation practices regarding the alleged pro-ecological activity of companies. It can be concluded that the phenomenon of greenwashing is aimed against green consumption and thus against sustainable development.

Greenwashing is a persistent issue in today's markets. Together, consumers can play an instrumental role in building a more sustainable future by demanding transparency and accountability from companies. Advocating for genuine sustainability and making informed choices can contribute to a healthier planet. The Negative Impact of Greenwashing refers to: consumer distrust, Damage to Genuine Sustainability Efforts, Hindrance to Environmental Progress, regulatory and Legal Consequences. False or misleading environmental claims can lead to fines, penalties, and damage to the company's reputation.

Fundamental shifts in consumption patterns are needed through using low impact products and services or by switching to sharing and product-as-a-service models. Consumption culture is under the strong influence of marketing and needs to change. Consumers' choices are framed by current production systems. The recently adopted eco-design for sustainable products regulation (EU, 2024) is geared to promote safe and sustainable products and was designed for circularity from the outset. One of the main findings highlight the importance of consumer education to prevent misinterpretation of green-related terms and to promote sustainable consumption practices. The question is where the limit in environmental awareness and who should be responsible for it. Consumers and undertakings should work together for a more sustainable industry, and transparent and reliable certification schemes should serve as a guarantee of sustainability.

The objectives of the circular economy must be taken into consideration when enforcing competition law. Customizing competition strategy involves undertakings that use the circular economy approach rather than those that impose the linear economy approach.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Competition authorities must exercise caution due to the possibility of greenwashing. In that case these undertakings couldn't have a circular economy friendly approach of the antitrust regulations. When regulators discovered greenwashing and this became public recognized, it can reduce market power and market share of the company (Liu, Wang, & Wang, 2025).

# APPLY THE PRINCIPLES OF CIRCULAR ECONOMY AND INDUSTRIAL SYMBIOSIS ON THE PRODUCTION SECTORS OF CYPRUS: THE BENEFITS FOR CONSUMERS

**Kyriakidis Andreas**

*Researcher, Energy and Environmental Design of Buildings Research Lab., Faculty of Engineering, University of Cyprus, 1678, Nicosia, Cyprus*  
[kyriakidis.andreas@ucy.ac.cy](mailto:kyriakidis.andreas@ucy.ac.cy)

**Michopoulos Apostolos**

*Ph.D, Deputy Director of Energy and Environmental Design of Buildings Research Lab., Faculty of Engineering, University of Cyprus, 1678, Nicosia, Cyprus*  
[michopoulos.apostolos@ucy.ac.cy](mailto:michopoulos.apostolos@ucy.ac.cy)

## Abstract

The recent growth of industrial production in Cyprus resulted in an increasing stream of wastes and by-products, thus creating a significant challenge for achieving sustainable development. Industries that mainly belong to the construction sector are facing challenges concerning the efficient and environmentally friendly waste management. Furthermore, the rising prices in building materials burdening the local consumer market, affecting thus the house affordability.

Therefore, there is a need for developing new sustainable building solutions with lower cost that are in line with the efforts currently undertaken within the EU to reduce carbon emissions and improve waste management. An effective strategy that addresses these challenges is the development of industrial symbiosis schemes along local industries. This strategy is well defined by the LIAISE COST Action CA22110 “Cooperation, development and cross-border transfer of industrial symbiosis among industry and stakeholders”.

The aim of this study is to present a recently developed industrial symbiosis scheme based on a cross-sector collaboration, the overall methodological approach, the identified barriers, challenges, market drivers, and potential benefits for the consumers. This scheme supports the vision of European Union to promote the principles of circular economy across the production chain as it includes a cement industry, a quarry company, a manufacturing enterprise, and an academic and research organization. The aim of the consortium is to valorize the industrial wastes/ by-products into valuable raw materials and then to incorporate them in production processes of innovative and environment-friendly products. The re-developed products will have lower cement content, offering, thus, to the market, a solution with lower cost, higher environmental performance and lower material footprint. Finally, using industrial by-products to develop cementitious materials will promote circular economy, improve waste management in Cyprus and establish an effective symbiosis process among the local industries.

**Key words:** Industrial symbiosis, construction, innovative products, barriers, challenges, market drivers, consumer benefits

## Abstract

One of today's most pressing global challenges is ensuring sustainable production and consumption patterns, as outlined in Sustainable Development Goal 12 (SDG 12) of the United Nations 2030 Agenda. Waste generation—from food and construction waste to plastics and electronic equipment—is closely linked to unsustainable consumption models, posing significant environmental, social, and economic risks. This paper investigates the implementation of SDG 12 in the Greek context, with particular emphasis on waste and refuse management policies.

Adopting a qualitative policy analysis approach, the study explores legislative frameworks, strategic planning, and funding mechanisms at the European, national, and local levels. Special focus is placed on the role of local government organizations (LGOs) in operationalizing national strategies, citizen engagement, and behavioural practices that support sustainable waste management.

The study identifies challenges and progress in achieving waste reduction, reuse, and recycling targets from official EU documentation, national legislation, and policy instruments. Comparative insights are also offered regarding best practices from other European Union member states.

The findings underline the importance of a multi-level governance model integrating top-down regulatory action with bottom-up civic participation. The paper concludes by proposing targeted policy recommendations and individual actions to enhance Greece's alignment with SDG 12 and support the broader transition toward a circular economy.

**Keywords:** SDG 12, Greece, waste management, circular economy, local governance, citizen participation

### Introduction

The present study focuses on waste and refuse management, one of the 17 Sustainable Development Goals (SDGs) adopted on 25 September 2015 during the 70th General Assembly of the United Nations and established by the United Nations (UN).

Regarding the subject of this work, it is important to note that more than 7 billion of us produce waste daily. Astonishingly, half of this waste is not collected, treated, or safely disposed of, creating a global waste crisis. Generating massive volumes of municipal solid waste (MSW) and its mismanagement creates serious environmental problems with social, political, and economic implications. Developing integrated waste management systems is imperative to reduce the impact on the environment, human health, and the economy.

More specifically, waste management in the European Union is a key sector in transitioning to a circular economy and consolidating overarching goals such as secure access to resources, social well-being, economic development, and environmental protection. Furthermore, the rapidly growing waste management industry enables the use of waste as a resource and the recovery of raw materials. At the same time, the health and environmental impacts of waste management must also be considered (European Commission, 2015).

Before delving deeper, it is essential to briefly highlight some of the major concerns surrounding waste management to fully understand why it constitutes such a critical issue in our time.

Firstly, globally, we produce vast quantities of waste: food and garden waste, construction and demolition debris, mining waste, industrial waste, liquid waste, old televisions, cars, batteries, plastic bags, paper, sanitary waste, old clothes and furniture, and the list goes on. The quantity of waste we generate is closely tied to our consumption and production patterns. The overwhelming number of products entering the market is a further challenge. Demographic changes—such as the rise in single-person households—also impact the volume of waste produced (e.g., goods are increasingly packaged in smaller units).

At the same time, it is widely known that poor waste management contributes to climate change and air pollution and directly affects many ecosystems and species. Some ecosystems, such as marine and coastal areas, can be severely affected by inadequate waste management and illegal or "irresponsible" individual littering. Marine litter is increasingly concerning—not only for aesthetic reasons: entanglement and ingestion are serious threats to many marine species.

Waste also indirectly impacts the environment, as any material not recycled or recovered represents a loss of raw materials and other inputs used throughout the value chain—in the production, transport, and consumption phases. The environmental impacts across the life cycle of a product are significantly greater than those solely linked to waste management (EEA Signals 2014 – *Well-being and the environment. Waste: a problem or a resource?*, 2021).

Moreover, illegal activities such as dumping, burning, and exporting play a role, though it is difficult to estimate their full extent or impact accurately. In general, directly or indirectly, waste affects our health and well-being in numerous ways.

Therefore, it is reasonably clear that the SDGs cannot be achieved unless waste management is treated as a priority. Failed economic models treat resources as infinite, and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

current consumption patterns encourage the perception of their endless availability. We must recognize that we cannot continue with a growing and increasingly urbanized global population without sorting and managing waste appropriately.

The goal of this study is to present the long-term strategic planning of waste management through legislative and administrative measures, infrastructure projects, and funding initiatives by the European Union and to investigate, as thoroughly as possible, the implementation of the proposals and projects of the National Waste Management Plan (NWMP) for the management of Municipal Solid Waste (MSW) by the Regional Authorities.

Accordingly, the main themes of this paper include a comprehensive description of the relevant SDG, an analysis of the current situation, EU policies, actions, and funding instruments; Greece's national policies and projects, and the role of Local Government Organizations (LGOs) in ineffective waste management. Finally, the paper attempts to present concise proposals for individual actions that can contribute to achieving this goal.

### **Chapter 1: Description of SDG 12 (Responsible Consumption and Production): Waste and Refuse Management**

The Sustainable Development Goals (SDGs), also known as the Global Goals, were adopted by the United Nations in 2015 as a universal call to action to end poverty, protect the planet, and ensure that all people enjoy peace and prosperity by 2030. This paper focuses on Goal 12, which concerns the "promotion of sustainable consumption and production patterns (SCP)," and more specifically, on the target related to environmentally sound waste and refuse management.

According to the United Nations Regional Information Centre (UNRIC), the sub-targets of this goal include:

- By 2030, per capita global food waste will be halved at the retail and consumer levels, and food losses along production and supply chains, including post-harvest losses, will be reduced.
- By 2020, achieve environmentally sound management of chemicals and all wastes throughout their life cycle, per agreed international frameworks, and significantly reduce their release into the air, water, and soil to minimize adverse impacts on human health and the environment.
- By 2030, substantially reducing waste generation through prevention, reduction, recycling, and reuse.

*(Goal 12 – Responsible Consumption and Production, <https://unric.org/el/στοχοσ-12-υπευθυνη-καταναλωση-και-παρα/>)*

First, let us clarify the waste terminology and its types and classifications. A fundamental legislative text for the definition of waste is Directive 2008/98/EC of the European Parliament, which states: *"Waste means any substance or object which the holder discards or intends or is required to discard."*

As for waste classification, many scholars group waste into various categories with different characteristics. Based on their physical state, waste can be classified into three main types:

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- Liquid
- Solid
- Gaseous (Amasoumo & Baird, 2016)

**Liquid waste** refers to solid residues dissolved in a liquid medium (water or some organic solvent) and constitutes one of the main sources of environmental pollution today. Major sources include domestic, municipal, and industrial waste. (*modernanalytics.gr, Chemical and Microbiological Analyses › Waste*)

**Solid waste** includes urban refuse, industrial waste (e.g., packaging remnants, empty barrels, cardboard, plastic wrappings), construction and demolition debris, petroleum-based waste, agricultural and livestock waste, mining and excavation waste (from both land and sea), sludge from urban wastewater treatment and industrial processes, hospital waste, tyres, and scrap materials.

(*modernanalytics.gr, Chemical and Microbiological Analyses › Waste*)

**Gaseous waste** (or aerosols) includes urban aerosols and gaseous by-products from processing, typically consisting of fine particulate matter or misted liquid substances (e.g., solvents, acids) with high volatility. (*modernanalytics.gr, Chemical and Microbiological Analyses › Waste*)

Additionally, the **waste producer** is defined as any person whose activities generate waste (the original producer) or any person involved in pre-processing, mixing, or other operations that alter the nature or composition of the waste. The **waste holder** is either the producer or the natural/legal person possessing the waste.

**Waste management** itself is also defined in various ways. Solid waste management refers to handling waste in a manner that is safe for both the environment and the public, and it is inherently interdisciplinary, incorporating theory and practice from economics and public administration (Tchobanoglous et al., 1993). The main objectives of waste management are to protect human health and the environment and to conserve resources (Brunner & Fellner, 2007).

Directive 2008/98/EC states, "*Waste management means the collection, transport, recovery and disposal of waste, including the supervision of such operations and the after-care of disposal sites.*"

To support stakeholders in waste management regarding the complex issue of waste definition and classification, the European Commission has published a guidance list. This **European Waste Catalogue (EWC)** (see Appendix) classifies waste by its origin and its risk to human health and the environment (Wild et al., 2013).

The EWC is divided into 20 chapters, corresponding to 20 broad activity categories. Each category is further subdivided, specifying production activities and identifying specific types of waste.

Furthermore, the catalogue categorizes waste based on the risk it poses:

- **Inert waste:** Waste that does not undergo significant physical, chemical, or biological changes.
- **Hazardous waste:** Waste containing explosive, infectious, flammable, corrosive, or toxic substances or those causing mutagenesis, carcinogenesis, teratogenesis, irritation, or other reactions. These are marked with an asterisk (\*) in the EWC.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- **Non-hazardous waste:** Waste that contains no hazardous characteristics and poses no harm to health or the environment.

At a European level, the **main principles of waste policy** include:

- The principle of health and environmental protection.
- The waste hierarchy principle.
- The proximity principle (disposal close to the point of generation).
- The producer responsibility principle.
- The life-cycle principle.
- The precautionary and remediation principles. (Amasoumo & Baird, 2016)

The **fundamental goals** of waste management are:

1. Waste prevention,
2. Recovery (recycling and secondary raw material or energy production),
3. Safe disposal of non-recoverable waste.

Finally, a key policy tool is the **waste hierarchy**, which evaluates actions from most to least favourable regarding resource and energy use. It aims to maximize the practical benefits of products and minimize waste generation. Proper application of the waste hierarchy can contribute to reduced greenhouse gas emissions, less pollution, energy savings, conservation of resources, job creation, and green innovation (*Wikipedia, Waste hierarchy*).

## Chapter 2: Description of the Current Situation – Problems

Given the rapid urbanization and growing global population, annual waste generation worldwide is projected to reach **3.4 billion tonnes** within the next 30 years, up from **2.01 billion tonnes** in 2016.

According to the study *Material-Efficient Utilization of Waste Oils—Biodegradability and Other Chemical Properties of Vegetable Recycling Oils* (2012), high-income countries, although comprising only 16% of the global population, generate over one-third (34%) of the world's waste. In addition, the East Asia and Pacific region is responsible for nearly one-quarter (23%) of total waste. It is also projected that by 2050, waste generation in Sub-Saharan Africa will triple, while in South Asia, it will double. (*THE WORLD BANK Website, 2018*)

Simultaneously, waste management and disposal practices have significant environmental implications. For instance, landfilling occupies land resources and may pollute the air, water, and soil depending on construction quality, while incineration can lead to atmospheric emissions. Landfills, which are considered the final option in the waste hierarchy, release methane—a highly potent greenhouse gas linked to climate change. Methane is formed by microorganisms acting on biodegradable waste such as food scraps, paper, and yard waste. Once waste is collected, it is transported and processed, releasing carbon dioxide—the most prevalent greenhouse gas—as well as other air pollutants, including particulate matter. Based on the volume, composition, and treatment methods of waste, it is estimated that **1.6 billion tonnes of CO<sub>2</sub>-equivalent emissions** were generated globally in 2016 from waste treatment and disposal—approximately **5% of total global emissions**.

As **Laura Tuck**, former Vice President for Sustainable Development at the World Bank, aptly stated:

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

"Poor waste management harms human health and the local environment, contributing to the climate challenge. Unfortunately, the poorest in society are often the most adversely affected by inadequate waste management. However, it does not have to be this way. Our resources must be used and reused continually so they do not end up in landfills."

Solid waste management is critical to developing sustainable, healthy, inclusive cities and communities. Nevertheless, it remains overlooked, particularly in low-income countries. While over one-third of waste is recovered through recycling and composting in high-income nations, **only 4%** of waste is recycled in low-income countries.

Supporting countries in making strategic decisions regarding financing, policy, and planning of Solid Waste Management (SWM) systems is critical. Key solutions include:

- **Providing funding** to countries most in need—especially those experiencing rapid development—for implementing state-of-the-art waste management systems.
- **Supporting large waste-producing regions** in reducing plastic and marine litter through comprehensive waste reduction and recycling programs.
- **Food waste is reduced through consumer education, organic waste management, and coordinated programs.**

Since 2000, the World Bank has committed **over \$4.7 billion** to more than **340 solid waste management projects** across the globe. (*THE WORLD BANK Website, 2018*)

Consequently, the overarching aim of waste management policies—particularly those of the European Union, which are a focal point of this paper—is to mitigate waste's environmental and health impacts and improve resource efficiency. The long-term objective is to **reduce waste generation** and, when unavoidable, to promote waste as a **resource**, achieving **higher levels of recycling** and ensuring **safe final disposal**.

### Chapter 3: Policies and Actions – European Union Funding for Waste and Waste Management

In 2015, the European Commission adopted the **Circular Economy Action Plan**, establishing a long-term strategic framework to promote **waste prevention**, increase **recycling and reuse**, and reduce **landfilling and incineration**. The plan outlines specific measures to assist businesses, citizens, and public authorities in benefiting from the transition to a greener and more resilient economy.

The circular economy seeks to "close the loop" of product life cycles by maintaining the value of resources within the economy for as long as possible, thus promoting more efficient use of raw materials, products, and waste. It contributes directly to achieving the European Union's environmental and climate objectives while fostering local and regional development. Waste prevention, eco-design, and similar practices contribute to cost savings, increased business turnover, and job creation—particularly in the sectors of **reuse, refurbishment, repair, and product innovation**. The circular economy is also one of the 12 themes of the **Urban Agenda for the EU**, through which cities collaborate with the European Commission, Member States, and stakeholders to address waste, resource efficiency, and the sharing economy.

The **EU Cohesion Policy** is the cornerstone of circular economy implementation. The 2014–2020 investment framework allocated substantial resources to **waste management**,

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**resource efficiency**, and **low-carbon investments**. Investment data can be accessed through the European Commission's **Open Data Platform** and are often complemented by private funding and other EU instruments such as **Horizon 2020**, **LIFE**, and **COSME**. (*European Union Website, Cohesion Policy Support for the Circular Economy*)

EU investments are tailored to local needs and opportunities and have supported:

- Greater recycling capacity,
- Improved waste management systems,
- Resource and energy efficiency,
- Strengthening of the bio-economy,
- Innovative product design solutions,
- New business models, and
- Creation of green jobs.

During 2014–2020, the EU allocated approximately **€4.3 billion** to actions focused on waste prevention, reuse, and recycling. In less-developed regions, investments targeted critical infrastructure for waste treatment, resulting in an **additional 4.5 million tonnes/year of recycling capacity**. Furthermore, **€1.5 billion** was invested in green production and resource-efficient processes for **Small and Medium-sized Enterprises (SMEs)**. The circular economy package also promotes **water reuse**—many EU regions already recycle treated wastewater for park irrigation, street cleaning, or groundwater replenishment.

In May 2018, new legislative targets on recycling and landfilling were adopted. Specifically, **Directive 2018/851** of the European Parliament set ambitious targets for the **reuse and recycling of municipal waste—at least 55% by weight by 2025 and 65% by 2035**. Additionally, the share of municipal waste going to landfills will be reduced to **10% by 2035**.

(*European Commission, 2018a & 2018b*)

In March 2020, the European Commission proposed a new **Circular Economy Action Plan** aligned with the EU's goal of **climate neutrality by 2050** under the **European Green Deal**. This updated plan focuses on waste prevention and management and aims to strengthen EU leadership in green innovation and competitiveness at the global level. (*European Parliament Website, Circular Economy Transition Plan*)

On **9 February 2021**, the European Parliament called for **stricter recycling regulations** and **legally binding targets** on material use and consumption, noting that limited resources and climate challenges necessitate a shift from the "take-make-dispose" model to a **climate-neutral, environmentally sustainable, and fully circular economy** free from toxic pollutants by 2050.

(*European Parliament Website, Circular Economy Transition Plan*)

Cohesion policy, however, extends beyond funding mechanisms. It offers a **comprehensive policy framework** for integrated regional development, emphasizing each region's unique strengths in implementing circular economy principles. It closely cooperates with local stakeholders, supporting regional authorities in building capacity and driving sustainable transformation. *A summary of the EU's legislative framework on waste management is provided in the Appendix.*

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### Project Example – Slovenia

With support from EU funds, Slovenia has achieved remarkable progress in waste recycling. In particular, the citizens of **Ljubljana** now benefit from a more sustainable waste management system. Since joining the EU, the Slovenian capital has enhanced **separate waste collection, increased recycling rates, and reduced landfill waste by 59%**. Investments also prioritized **waste prevention and reuse initiatives**. Ljubljana currently produces **41% less waste per capita** than the EU average and has **abandoned plans to construct two incinerators** originally scheduled.

A central element of this transformation is the **Ljubljana Regional Waste Management Centre**, an EU-funded project that initially served **17 municipalities** and later expanded to **37**, rendering additional waste treatment facilities unnecessary. (*European Union Website, Cohesion Policy Support for the Circular Economy*)

### Chapter 4: Greece's Policies and Projects for Achieving the Waste Management Goal

Greece's newly emerging environmental policy sector is currently undergoing a transitional phase, focusing on addressing long-standing challenges across several thematic areas, including waste management, wastewater, environmental permitting, and renewable energy. The country has recently developed key strategies in circular economy, climate change adaptation, and biodiversity. These are supported—among other initiatives—through the **EU's LIFE Programme**, particularly via three integrated projects with a total budget exceeding **€47 million**, expected to leverage an additional **€1.5 billion** in complementary funding over the coming years.

Nevertheless, Greece continues to face long-term challenges in several environmental sectors. Identifying investment needs for green technologies and sustainable solutions and ensuring sufficient funding will be essential to achieving the country's climate and energy goals and shaping a new development model. While EU funding has already contributed to building a greener economy in Greece, further investment is required—especially in **energy and transport infrastructure**—to promote sustainable development. In 2019, new initiatives were launched to address environmental and energy challenges, including investment plans focused on **efficient waste management** and **clean energy** to boost the competitiveness of the renewable energy sector.

The first attempt to establish a **national waste management strategy** at both national and regional levels occurred in 1997 with **Joint Ministerial Decision (JMD) 113944/97 (Official Gazette B' 1016/1997)**. This was later supplemented by **Ministerial Decision 14312/1302/00 (Official Gazette B' 723/2000)** and replaced by **JMD 50910/727/2003 (Official Gazette B' 1909/2003)** in order to ensure full compliance with **EU Directive 91/156/EEC**. JMD 50910/727/2003 established the guidelines, measures, and procedures required to mitigate the negative environmental impacts of waste through improved management.

Additionally, the **National Waste Management Plan (NWMP)** defines Greece's overarching waste policy and serves as the strategic framework for developing Regional Waste Management Plans (RWMPs), which cover the entire national territory.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The NWMP outlines national strategy, objectives, and quantitative/qualitative targets for managing various waste streams. It also specifies the policy axes and necessary actions in alignment with Greek and European legislation. The NWMP is prepared by the **Ministry of Environment and Energy** and approved by the **Council of Ministers**, ensuring political commitment and a unified national approach to waste management. (*Ministry of Environment & Energy Website, Solid Waste Management*)

The central goal of the NWMP is to promote environmental and public health protection by developing strategic policies and action plans. In pursuit of this objective—and ultimately of the legal requirement to transition toward a circular and sustainable economy—two core actions are emphasized:

1. **Waste prevention and reduction**, and
2. **Reduced use of natural resources**, with improved efficiency in their utilization.

Regarding waste, the plan sets an ambitious target: to reduce **landfilling of Municipal Solid Waste (MSW)** to less than **10% by 2030**.

The NWMP is aligned with Greece's **National Energy and Climate Plan (NECP)**, ensuring a coherent approach to securing **long-term competitiveness**, promoting **sustainable economic growth**, and supporting **job creation** in the context of the EU's 2050 climate neutrality goal.

(*Official Government Gazette, Approval of the National Waste Management Plan – FEK A' 185*)

The latest NWMP (2020–2030) introduces ambitious targets aligned with EU legislation and the **Circular Economy Package**, particularly concerning **source separation**, **recycling**, and **reuse**. It aims to achieve:

- **At least 55% preparation for reuse and recycling of MSW by weight by 2025 and 60% by 2030**,
- Limiting **landfilling to 10%** of generated MSW by 2030.

To reach these goals, the NWMP outlines concrete measures and responsible stakeholders. It particularly emphasizes:

- Expansion of **separate waste stream** collection,
- Promotion of **source separation**,
- Implementation of the **"Pay-As-You-Throw"** principle,
- Upgrading and reinforcing **Material Recovery Facilities (MRFs)**.

(*Ministry of Environment & Energy Website, Solid Waste Management*)

Furthermore, the plan includes **public awareness and outreach campaigns**, which are critical for achieving these targets. It also introduces a series of **legislative measures** aimed at:

- Waste prevention,
- Enhanced recycling, and
- Improving overall waste management in line with the strategic directions of the NWMP.

## Chapter 5: Policies and Actions of Local Government Organizations (LGOs) for Achieving the Waste Management Goal

**In Greece, local Government Organizations (LGOs)** are public legal entities established within specific territorial jurisdictions that administrate local affairs. Their governing bodies

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

are elected through universal suffrage by the local electorate. Implicit in the term is both a **geographical and demographic definition**, as each LGO has a defined area, headquarters, and population. According to the current administrative structure of Greece, every point in the country (except for Mount Athos) falls under the jurisdiction of a **primary-level LGO** (municipality) and a **secondary-level LGO** (region). (*Wikipedia, Local Government Organizations*)

The current administrative division of the country is detailed in **Official Gazette B' 1327/17.4.2019**, under the title: *"Primary and Secondary Local Government Organizations of the Country, in accordance with Law 3852/2010, as amended."* Ministerial Decision **28549/2019** provides an exhaustive list of all municipalities and regions, as established by Articles 1 and 3 of Law **3852/2010**.

Regarding the responsibilities of municipalities, **Article 75 of Law 3463/2006** specifies that they are responsible for the **cleanliness of public spaces, waste collection and management, construction and maintenance of sewage and biological treatment systems**, and the **implementation of preventative and corrective measures** to protect waste disposal sites, including fire safety compliance.

Furthermore, under **Article 228 of Law 4555/2018**, primary-level LGOs (municipalities) are assigned the following waste management responsibilities:

- Developing and implementing **Local Waste Management Plans (LWMPs)** and waste reduction/prevention programs;
- Establishing separate collection systems for at least **four recyclable waste streams**: glass, paper, plastics, and metals;
- Organizing a separate collection of **biowaste**, particularly from restaurants, households, large producers, and green waste from parks and gardens;
- Collecting and transporting **residual mixed municipal waste** and **source-separated recyclable materials** to suitable recycling, recovery, or disposal facilities following the respective **Regional Waste Management Plans (RWMPs)**;
- **Eradicating illegal waste disposal sites** and restoring existing **Uncontrolled Waste Disposal Areas (UWDA)**;
- Conducting **citizen awareness and outreach campaigns** within the municipal boundaries and encouraging actions aligned with circular economy principles;
- Registering all relevant data in the **Integrated Waste Management Information System**, developed by the General Secretariat for Waste Coordination and Management of the Ministry of the Interior, for monitoring project implementation and target achievement.

(*Article 228, Law 4555/2018*)

One notable initiative, **"Open Municipality – Active Citizens,"** includes proposals for promoting **recycling and source separation** at the municipal level. (*Theofilopoulos G., Open Municipality – Active Citizens, Recycling & Source Separation: Our Proposals*)

In parallel, each region's **RWMP** constitutes a comprehensive framework for managing all waste streams generated within its boundaries. It sets forth general management guidelines in alignment with the national NWMP and Articles 22 (Management Plans) and 23 (Waste Prevention Programs). The RWMP proposes appropriate measures that promote, in a hierarchical and integrated manner:

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- a) Prevention,
- b) Reuse,
- b) Recycling,
- d) Other forms of recovery (e.g., energy recovery), and
- c) Safe final disposal.

The RWMP's policy pillars are centred on:

- **Preserving the public character** of waste management to protect public health and the environment under a sustainable development framework for the benefit of society;
- **Integrated planning** for all waste streams in the Attica Region at both regional and local levels, consistent with the National Waste Prevention Strategy;
- Ensuring **high-level protection of the environment and public health**, with adequate and appropriate infrastructure for collection, recovery, and disposal;
- Promoting **resource-efficient practices** for the benefit of society in an equitable manner;
- Strengthening the implementation of **Extended Producer Responsibility (EPR)** mechanisms;
- Enhancing the **quality of municipal waste management services** provided to citizens and businesses;
- Fostering **public engagement and participation** in waste-related initiatives;
- **Rationalizing service costs** and encouraging environmentally and economically sustainable investments.

*(Special Inter-Municipal Association of the Attica Region, 2021)*

## Part II – Chapter 6: Proposals for Individual Actions to Achieve the Waste and Refuse Management Goal

Achieving sustainable waste management is not solely the responsibility of governments and institutions—it also depends heavily on the **daily behaviour of individuals**. The following actions, though simple, can significantly contribute to minimizing waste generation and promoting circular practices at the household and community levels.

### ***Composting***

Though often perceived as an advanced environmental practice, **composting** is a simple and highly effective method to divert food waste from landfills. Approximately **25% of household waste** could be removed from the waste stream and converted into nutrient-rich compost. While composting may require a certain commitment, the return on investment is tangible: within **3 to 12 months**, households can produce natural fertilizer for their gardens or plants.

### ***Responsible Recycling***

Recycling standards differ across regions. Familiarizing oneself with **local recycling guidelines** is crucial to avoiding common mistakes—such as recycling contaminated materials (e.g., greasy pizza boxes), which may result in entire loads being sent to landfills.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Effective recycling begins with understanding **what is and is not recyclable** in each local context.

### *Waste Auditing*

Awareness begins with self-observation. By monitoring one's daily waste output—**maintaining a record for a day or week**—individuals can identify opportunities to **replace disposable items with reusable alternatives**. This habit can gradually evolve into a **personal goal** to reduce single-use consumption and embrace more sustainable practices.

### *Sustainable Purchasing Habits*

Households can reduce waste by purchasing products with **minimal or recyclable packaging**. Not all plastics are created equal: the **number within the recycling triangle symbol** indicates the recyclability of each item. In general:

- **PETE (1) and HDPE (2)** are **highly recyclable**.
- **PVC (3), LDPE (4), PP (5), and PS (6)** are **less or not recyclable**.
- **Type 7 (Other)** is **generally non-recyclable**.

Choosing products with packaging types 1 or 2 can ensure greater compatibility with local recycling systems.

### *Reducing Kitchen Disposables*

Convenient items like plastic wrap, aluminium foil, paper towels, and zip-lock bags generate a significant volume of kitchen waste. Alternatives like parchment paper, reusable silicone baking sheets, and washable cloth napkins can reduce disposable usage and waste production.

### *Buying and Donating Second-Hand Items*

**Second-hand goods**, especially clothing, are valuable to a sustainable consumption model. Purchasing or donating used clothing extends product life cycles and reduces textile waste. Initiatives like **Fabric Republic** offer structured systems for managing surplus clothing in line with **EU Directive 2008/98/EC**, contributing to developing a **European recycling society**. Moreover, buying second-hand supports **local charities** encourages **conscious consumption**, and promotes **cost savings**.

### *Supporting Local Farmers and Bulk Markets*

Shopping at **local farmer's markets** helps reduce packaging waste while supporting **regional agricultural producers**. These products often require less refrigeration and transportation, contributing to lower environmental impact.

### *Avoiding Plastic Bags*

Every hour, **200,000 plastic bags** end up in landfills. Investing in **fabric or reusable shopping bags** is a simple yet highly effective way to reduce plastic waste and its long-term environmental footprint.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

### ***Reducing Bottled Water Use***

An estimated **60 million plastic water bottles** are discarded daily worldwide. The use of **reusable water bottles** offers an environmentally sound and cost-effective alternative.

### ***Limiting Paper Use***

In today's digital age, **paperless billing** is increasingly common. Many businesses offer incentives for choosing electronic communication. Reducing paper consumption—whether through digital receipts, notes, or subscriptions—can significantly contribute to reducing household waste.

## **Conclusions**

It is evident that **sustainable waste and refuse management** constitutes a central pillar of the broader effort to transition toward a **circular and climate-resilient economy**, both at the European and national levels. The challenges are multifaceted—environmental, social, economic, and institutional—and call for coordinated actions across all levels of governance. The legislative framework and funding mechanisms have been significantly reinforced at the European Union level through successive **Circular Economy Action Plans**, legally binding **recycling targets**, and a wide range of **cohesion policy instruments**. These measures aim to reduce environmental burdens, enhance resource efficiency, and generate green jobs through innovation, investment, and systemic change.

In **Greece**, significant progress has been made in aligning national strategies with European directives. The formulation and implementation of the **National Waste Management Plan (NWMP)** and the corresponding **Regional Plans** reflect a growing institutional commitment to modernize infrastructure, adopt new technologies, and promote best waste prevention, reuse, and recycling practices.

The role of **Local Government Organizations (LGOs)** is also pivotal. Municipalities and regional authorities serve as the operational backbone for implementing waste management policies, with responsibilities ranging from separate collection and recycling schemes to citizen awareness campaigns and digital monitoring systems. Their capacity to integrate local knowledge with national priorities enhances the effectiveness and inclusiveness of waste policy interventions.

However, technical solutions alone are not sufficient. The transition to sustainable waste management requires a **cultural shift**—a reconfiguration of values, habits, and consumption models. This underscores the critical role of **citizen participation**, **individual behavioural change**, and **community engagement** in complementing institutional efforts.

In this context, small-scale individual actions—such as composting, responsible recycling, sustainable purchasing, and reduction of single-use plastics—can collectively generate significant environmental benefits. Furthermore, promoting second-hand use, reducing food waste, and embracing minimal packaging practices contribute to a societal model in which **waste is no longer a by-product but a resource** to be reintegrated into the economic cycle.

In conclusion, achieving **Sustainable Development Goal 12** in waste and consumption is an **ongoing process** that requires strategic planning, regulatory coherence, robust

## PROCEEDINGS

---

infrastructure, informed policy-making, and an empowered and environmentally literate citizenry. Sustainability ambitions can only be translated into tangible outcomes for future generations through a holistic, multi-level, and participatory approach.

### **EU CIRCULAR ECONOMY NETWORK FOR ALL: CONSUMER PROTECTION THROUGH REDUCING, REUSING, REPAIRING**

**Plotnic Olesea**

*Moldova State University, Moldova*

[plotnicolesea.aum@gmail.com](mailto:plotnicolesea.aum@gmail.com)

#### **Abstract**

Achieving the objectives of the 2030 Agenda for Sustainable Development through sustainable consumption is a key priority for modern society. However, significant regional disparities within the EU and beyond, coupled with the absence of a cohesive strategic policy framework for regional development, highlight the urgent need for enhanced regional and cross-border cooperation.

This paper will explore strategies to foster awareness, reflection, and knowledge dissemination on circular economy principles among diverse audiences, including youth, academics, young researchers, public administration staff, the business community, and civil society. By emphasizing sustainable consumption, resource conservation, and waste prevention, the paper aims to empower stakeholders and promote consumer protection. A central focus will be on encouraging manufacturers to adopt responsible practices during product design and marketing, particularly by prioritizing reducing, reusing, and repairing strategies. These efforts aim to create a circular economy that benefits consumers while contributing to sustainable development goals.

**Key words:** Circular economy, sustainable consumption, consumer protection, reducing, reusing, repairing, regional cooperation, waste prevention, sustainable development.

## **Abstract**

Climate crisis is inseparably linked to water as it heightens fluctuations in the water cycle, leading to extreme weather patterns, impacting water supply and quality, and posing risks to sustainable development across the globe. Considering this, climate risk assessment in water infrastructure is a growing research field, driven by the increasing vulnerability of systems to climate-induced hazards. We need more investment in improved hydrological data, institutions and governance, education and capacity development, risk assessment and knowledge sharing (UN-Water Policy Brief on Climate Change and Water). This Review Paper analyses existing research and methodologies developed to evaluate climate risks in water infrastructure, with a focus on Greece's specific challenges and environmental contexts. The study systematically reviews key approaches, including innovative technologies, such as digital twins of water supply networks (GIS and hydraulic modelling), along with simulation scenarios. By examining existing climate risk assessment methods and recent pilot projects, this review highlights the strengths and limitations of each method, addressing gaps in data integration and predictive accuracy. Additionally, the paper identifies opportunities for future research in enhancing risk assessment models by integrating Artificial Intelligence (AI), fostering adaptive infrastructure planning, and integrating stakeholder engagement and capacity building. This comprehensive analysis aims to guide public authorities, policymakers, and market participants in selecting and improving climate risk assessment tools to support sustainable water management and water resilience.

**Key words:** Climate Risk Assessment, Water Infrastructure, Water Management, Water Resilience, Artificial Intelligence, Digital Twins

#### Abstract

Data has become an essential resource for economic growth, job creation, and societal advancement. This global trend offers vast potential across various sectors, including health, environmental sustainability, climate resilience, resource efficiency, energy, urban development, intelligent transport systems, smart cities and more others.

A data-driven public sector is transforming how public policies and services are designed and delivered through strategic data management, sharing, and utilization. As governments increasingly recognize data as a critical asset for creating public value, efforts have been made to bridge legacy systems and dismantle organizational, operational, and infrastructure silos, paving the way for a more data-centric public sector. Making more data accessible and optimizing its use is crucial for addressing societal, climate, and environmental challenges, ultimately fostering healthier, more prosperous, and sustainable cities.

More specifically, the availability of environmental data has the potential to improve urban governance, particularly in building resilience and facilitating climate change

mitigation and adaptation. Better environmental data is essential to confront urban challenges posed by the climate crisis. Such data is crucial for improved monitoring and management of urban systems and enables thorough evaluations of policy and planning interventions.

In this paper, we explore how local authorities are adopting data-driven tools to pave the way for more effective and sustainable urban transformations. We specifically present the case of a data-sharing platform developed to assist municipalities in Thessaloniki's metropolitan area in enhancing their policies for climate change adaptation and mitigation. This initiative, undertaken by the Major Development Agency of Thessaloniki and the Open Knowledge Foundation Greece, showcases a data-sharing platform developed in the framework of the Horizon Europe UPGAST project, which addresses components for safe, fair, and interoperable data exchange.

#### **Abstract**

As an implementation study funded by "The Greek Green Fund," the project "HERitage MONitoring" aims to investigate whether it is possible to monitor and predict the alteration and collapse of historic buildings due to the changing environmental conditions caused by climate change. With the medium- and long-term study of the data in combination with the prevailing climatic conditions, conclusions will be drawn about the relations between them, and a system of early intervention will be proposed to deal with possible collapses and losses of essential elements of the monuments. The pilot application is in the city of Ermoupolis (Syros, Greece), where ten historic buildings from the digital database "HERMES" were selected in the first phase for monitoring. These buildings have an adequate geographical dispersion within the city and belong to different typologies and pathology phases. Buildings owned by the Municipality (or legal entities that the Municipality also participates in), the wider public sector, unknown owners, and well-known owners who gave their consent were selected. Along with the selection of buildings, the choice of parameters monitored in real-time was made. To record the values of the parameters, the basic infrastructure for the collection, transmission, storage, and visualization of data (databases, application server) was developed with the supply, installation, and trial operation of the equipment to evaluate and implement its final installation in the selected buildings. The data are collected in real-time and digital form using special sensors connected and powered by a small unit with a battery

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

installed in the buildings. The collection of these data, and their study will allow the categorization of problems in buildings according to their criticality risk. This enables targeted priority conservation and better use of human, technical and financial resources and sets the foundation for the design of an alert system. The visualization of data in a web application allows remote access to them and thus both their study by external researchers and the information and awareness of citizens and the planning of interventions by the competent services. Finally, innovative data collection and transmission technologies should allow the system to be further exploited for use in other areas of interest (environment, health, urban mobility).

**Keywords:** Monitoring, Architecture, Heritage, Risk, Climate Change, Prevention, Sensors, LoRaWAN

### Introduction

Monumental structures are reflections of civilization and the builders who constructed them. They serve as a record of societal and cultural development. The way and timing of a building's conception, construction, use, abandonment, and eventual destruction reveal a society's growth and collapse. According to this perspective, preserving monuments as a part of a location's cultural history is especially significant because it can reveal a lot about the development of our culture and can also attract visitors, producing basic income from tourism. [1] On a grand scale, all cities can be considered "pieces of art." Except that this form of art is transient and cannot be controlled or altered as quickly as other forms of art, like music. Diverse people will eventually have different experiences in the city [2]. "Building is a process that goes on forever, as long as people inhabit an environment. It does not start here with a preconceived design and end there with a finished object. The 'final form' is nothing but fleeting..." writes Ingold, Professor of Anthropology at the University of Aberdeen, in his book 'The Perception of the Environment: Essays in livelihood, dwelling, and skill' [3]. However, humans inhabit a city in a short amount of time compared to the life of the city itself and should not impose predetermined patterns on it and its environment. Humans should adapt to the city, develop it according to the demands of the environment, and bequeath it to the next inhabitants.

An architectural monument has an essential role: to promote human memory and serve as a connecting link between the present and the past. The role is twofold, as the monument answers the problems of the present and preserves the memories of the past. When the monument is placed in the urban environment, it charges memories, ignites the imagination, and creates specific psychology in humans [4], [5]. The monument as a work of art is perceived only in a specific cultural environment, not everywhere, and certainly not always and not by everyone. Heidegger uses the word "Bewahrung," which means "preservation," but it has the same root as the word "Wahrheit," which means "truth," giving preservation the direction of preserving the "truth" of the monument [6]. But the monument, like any building, has a life cycle: It is born, it lives, and it dies, having its own life expectancy that differs significantly from building to building. Engineers are usually trained in the construction of buildings and complete their work when their creation is finished. Then the building begins to

## PROCEEDINGS

---

play its role, i.e., to accept all stresses and remain stable in its position [7]. The need to safeguard the unique characteristics of historic locations and their monuments is therefore indisputable. Monuments play a crucial role in tourists' aesthetic evaluation in historical and traditional towns where authenticity, originality, time, and scale are fundamental components of their image. The following logical question is, "How can one monitor the monuments of a historical site to safeguard them?"

Ermoupolis is a unique neoclassical ensemble at the national and global level, as the NTUA research records more than 1,200 buildings that have survived to this day. At the same time, since 2013, the Syros Institute, in collaboration with the Municipality of Syros-Hermoupoli, has been digitally monitoring all the historic buildings through the digital database "HERitage Management e-System (HERMES)," which has been distinguished for its innovation by the European Union [8]. HERMeS proved that a large number of buildings (more than 137) currently have serious pathology problems, and some of them may collapse. In the last year, the collapses of historical buildings and monuments in Ermoupoli have increased, attracting the media's attention to the risk of losing National cultural heritage [9]. The purpose of the project "HERitage MONitor" (HER-MON) is the installation of a real-time pathology data collection network of the historic and preserved buildings of Ermoupolis, intending to immediately utilize this data for the early diagnosis of problems and the planning of the necessary intervention actions as a priority. Digital data are collected by autonomous measuring devices (sensors) installed in the selected buildings, transmitted at regular intervals, and stored in a database for further study and visualization. For the needs of the HER-MON, we used innovative technology that allows data transmission over long distances with extremely low energy consumption and without the obligation for user licenses. This reduces the maintenance cost of the equipment and increases its sustainability, expandability, and repeatability in other cities and regions.

### **Methodology**

#### ***Preparation and Research***

The first phase selected the historical buildings to be studied through the "HERMES" digital database. The selected buildings are geographically dispersed in Ermoupolis; they belong to different typologies and are in various states of pathology. The above data are in possession of the Syros Institute in a geodatabase [10]. The selected buildings are owned mainly by the Municipality (or by legacies in which the Municipality also participates) and by an unknown owner. In this way, the proposed activities in the buildings do not bind owners who would have to allow equipment to be installed in their buildings. To select the historical buildings, we followed a four-step inquiry: (i) Researching in HERMES database (1.200 buildings), (ii) Filtering buildings with different typology, style, year of construction, and conservation state (32 buildings selected), (iii) Spreading the buildings to different geolocation (18 buildings selected), (iv) Visiting the final 18 buildings in-site to understand the challenges (10 buildings selected as shown in Figure 1

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Figure 3. From 1.200 historical buildings (left), ten buildings were selected to host HERMON sensor devices (right).

Along with the selection of the buildings, the parameters that are monitored in real-time were also chosen. Indicatively, such parameters are temperature, relative humidity, and atmospheric pressure in closed buildings with the aim of early warning about the water inflow. Also, the inclination of the stone structures - especially the facades of the buildings or main structural components, such as the roof beams- the range of selected cracks and gaps, the vibrations in the building, and other elements of their pathology are recorded. It was important to install an essential infrastructure for the data study: visualization applications (databases, application server) were developed. We tested the operation of part of the equipment to evaluate and propose the technological solution that was developed.

### ***Field Activities***

The next step was the study and installation of the telecommunications infrastructure and the structure of the monitoring devices at the selected points. The proposed monitoring network is technologically innovative and does not require a connection to a power network or the Internet (WiFi). Therefore, the installation is direct, without special requirements. The placement was done with the help of specialized staff (from partner “Kudzu”) and members/volunteers of the Syros Institute and HERMeS NGO. After the installation was complete, the entire system flow was tested, starting from the collection of the data, sending it in time, storing it, and ending with its presentation. The Kudzu IoT hardware platform measures and monitors the required parameters. It is a modular sensor data collection and transmission system that can operate autonomously in the field for a long time. It consists of

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

three distinct parts that will be described in detail below, the power and communication accessories and the sensor elements, which may vary according to the needs of the installation. It provides excellent flexibility in collecting and transmitting data, significant energy autonomy, low construction cost for mass monitoring and easy installation. It allows the collection of data from different sources (sensors) and their parameterization in the field even after the end of the installation, thus providing the opportunity to enrich the prediction model with new data where this is deemed necessary [11]. Another feature of Kudzu IoT that makes it suitable for this project is the ability to feed from different sources. Thus, it can be modified according to the needs of each installation, allowing its uninterrupted operation for an extended period. It allows operation with battery power or direct power supply where possible. Conclusively, it allows the use of solar power to help supply energy to remote installations where it is impossible to change the energy source periodically. Lastly, Kudzu IoT allows data transmission using the most basic wireless transmission protocols without selecting a predefined mode. Thus, the collected data can be transmitted via WiFi technology where this is available (e.g., homes or public buildings in operation) or by making use of the mobile telephony data network or even using LoRaWAN technology that allows the transmission of data over long distances with minimal energy consumption [12] [13]. It is still possible to transmit data via satellite link, which is not considered necessary in this project but may be helpful in the future for monitoring buildings and monuments that are outside the coverage of traditional telecommunications infrastructure.

Figure 2. Left: An example of the coverage of the LoRaWAN network for one of the selected historical buildings that the HER-MON monitors. Right: Screenshot of live data from HERMON web portal ([www.hermon.gr](http://www.hermon.gr))

After that, a website was created to present the data in real-time, covering the need to disseminate the project results. It features access control to separate its use between system administrators and external visitors. After the pilot operation, the necessary corrections were made, and the network installation was finalized. The network was announced through the appropriate actions of the Syros Institute, including a Workshop on the topic of Cultural Heritage at Risk (Heritage at Risk) in collaboration with local, national, and European bodies (Municipality, Region, Ministries, Europa Nostra, etc.), an analytical training with the aim

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

informing the local agencies of the island, and in particular the intervention agency (Directorate of Technical Services of the Municipality of Syros-Hermoupoli) regarding the operation and objectives of the monitoring network of historic buildings, and the issuance of a digital guide for the operation and installation of similar networks in other buildings or places.

### ***Exploitation and Dissemination Activities***

In a “Digital Tools in Cultural Heritage” workshop in Syros, Greece, we presented the project's ideas and outcomes to various national and international experts, professionals, architectural heritage activists, and students. We also cooperated with other projects that use IoT for monitoring with sensors similar variables for natural and cultural heritage [14][15], exchanging valuable knowledge.

Figure 3. Dissemination Workshop demonstrated the use of sensors in a variety of projects for cultural heritage

## **Results and Discussion**

The project HER-MON successfully addressed several difficulties and challenges in using IoT for monitoring the conservation state of historic buildings at risk:

1. The buildings to be studied are usually off-the-grid (there is no power supply). Collecting data and monitoring their condition has always been exceptionally high in cost, material, services, and maintenance.
2. Many recording devices collect the data locally, so their physical collection is required for their utilization. When the study of the information is delayed, there is no possibility of early intervention.
3. While there is a wide range of accurate monitoring sensors that measure the pathology state of buildings, the industry doesn't offer options for low-cost monitoring systems that are easily accessible and installed in mass on a historical settlement consisting of many buildings.
4. The collected data are usually transmitted via mobile networks within the urban web. Data transmission is expensive (data usage private contracts) and requires high energy consumption, increasing maintenance costs (battery replacement, charging, etc.)
5. Also, the possibility of using mobile networks is limited to the areas where it is covered by cell phone companies, making it impossible to transmit data from remote locations. Especially in the South Aegean region, many important historical monuments are not covered due to insularity.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Figure 4. Visualization of selected data of Building n.05: Municipality of Ermoupolis, from March 2024 to March 2025 (1 year).

Until today (March 2025), the installed sensors are still successfully transmitting data. The installation has proven unexpectedly durable for over 2 years, considering some of the sensors are installed on the exterior façade of buildings, exposed to extreme wind and temperature. Collecting these data will help the stakeholders of HERMON to analyze and compare them over several years and calibrate a sensing pattern that can create an alert system for possible collapse. This way, valuable results will be produced on climate change's effect on these historical buildings, a theory strongly supported by the scientific community [16] [17]. It is stated that the ageing of materials is caused by their inherent physical and chemical properties and environmental conditions [18]. Extreme fluctuations in temperature and heavy rainfall stress the materials systematically. With the climate change observed in the last decades, these phenomena seem to become more intense and frequent. Climate changes in the coming years are expected to bring about:

- ✓ Increase in the frequency of extreme temperatures (single days but also hot episodes lasting at least three days)
- ✓ Increase in the intensity of phenomena (absolute maximum temperatures, amount of rain per hour)
- ✓ Increase in the duration (persistence) of the phenomena
- ✓ Time shift of the appearance of the phenomena [19]

The already burdened buildings will have to deal with these new conditions, even in a state of reduced strength. HERMON could become a helpful technology tool that senses the changes, records the data, and informs the stakeholders to take immediate action if necessary.

## Conclusions and future work

The project's general goal is to protect the man-made cultural environment of Ermoupolis through research and utilization of measurement data concerning the alteration of the city's historical buildings and monuments. To achieve the goal, the live monitoring of the pathology of ten (10) historic and preserved buildings of Ermoupolis is required, with the study and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

installation of an innovative network of sensors. Data collection in real-time and in digital form allows early prediction of problems. Analyzing these data will also enable categorizing issues according to their criticality. This way, priority-targeted rehabilitation, and the best utilization of human, technical and financial resources become possible. At the same time, the appropriate selection of buildings to be the most representative in terms of date of construction, problems and alterations, location in the city, and cultural value, allows the drawing of valuable conclusions for the whole of Ermoupolis. Based on these records, one can predict what to expect from all similar buildings. The visualization of the data in an online application allows remote access to them and thus both their study by external researchers as well as the information and awareness of citizens. An essential objective of the project is training the competent intervention service in dangerous buildings, namely the Technical Services Directorate, whose engineers will learn how to monitor the network and intervene when necessary. Finally, innovative data collection and transmission technologies allow the system to be further exploited for use in other areas of interest (environment, health, urban mobility).

Figure 5. Installation of a “HERMON” device in a 19th-century wooden beam on a roof

Future work includes research and analysis of the collected data to support the correlation between the increased rhythm of pathology problems in historical buildings and the intense environmental conditions because of climate change [20].

### KIFISSOS RIVER – A POSSIBLE DISASTER IN ATHENS

DOI: 10.26341/issn.2241-4010-2025-6a-5-K02039

#### Dimitrios Kampolis

*PhD candidate, University of Athens, Department of Geology and Geoenvironment, University Campus, 15784, Athens, Greece*

[dkapolis@geol.uoa.gr](mailto:dkapolis@geol.uoa.gr)

#### Abstract

Kifissos river is the largest and most important river of the Attica basin. The wide network of streams and the continuous flow have created a catchment area, which covers about 70% of the Athens basin making it the dominant river in the wider area and the main recipient of the rainwater of the Athens basin. The intense development of the wider urban complex of Athens has led to the disappearance of many kilometres of streams, while Kifissos river as the main passage to sea and draining the 70% of the waters of the Athens basin, suffers reduction in its width, arbitrary building, and pollution, as well as damaged by major hydraulic or road works. The decision of covering the river from the Three Bridges to Neo Faliro (A1 motorway /Kifissos Avenue) has no contribution of addressing the serious flood protection and environmental degradation problems of Athens basin which bound to become more severe in the future, especially after the recent fires in Parnitha and Penteli mountain.

The present paper investigates a possible disastrous flooding of Kifissos river from the area of Three Bridges and upstream. The covering of Kifissos river from the Three Bridges to its outfall at Faliro bay, does not allow any intervention to increase its drainage capacity, resulting in an increased possibility of flooding in case of extreme precipitation in the surrounding mountainous areas. The results have shown an increased possibility of flooding in a huge area at the west suburbs of Athens with high potential in human losses and properties and therefore a new facility for the floodwater diversion is imperative.

**Key words:** flooding, climate change, Kifissos river, Athens basin

#### Introduction

According to ancient Greek tragedian Euripides, Kallinaos Kiffisos was the biggest river of ancient Athens. It was referred and honored as the protector of Athens basin. The river springs in north and northeast mountainous mainland and it spreads through an extended network of small streams and rivers before reaching the modern mouth in Neo Faliro Bay. From ancient time till 19th century, the mouth was located at the nowadays modern port of Piraeus (Attiki Odos, 2009) (see image 1).

The area of Kifissos basin is 380km<sup>2</sup> and the river length is 22km. The longest part of this length runs through urban area with extended human interventions. There are still forestry and cultivated areas but most of Kifissos basin is built-up over 70% and it is still increasing.

**Image 1: Athens and surrounding areas (The Topography of Athens with Some Remarks on its Antiquities W.M.Leake, London 1821)**

In modern times, the flow of the lower river has changed comparing to ancient times. Modern bed runs western comparing to the ancient one from Sepolia and south, while modern mouth is located at Neo Faliro Bay (see image 2).

---

**Image 2: Kifissos river – ancient bed vs. modern bed**

During modern times, Kifissos river has suffered multiple interventions with reductions in its width, significant pollution from human activities and hydraulic or road works. The covered part from Three Bridges to Neo Faliro has caused some serious problems in water drainage and capacity of the river (see image 3).

According to published articles (Nikolopoulos 2008), the capacity of the settled part of Kifissos river ranges from  $400\text{m}^3/\text{s}$  (beginning of the closed section at Three Bridges) to  $700\text{m}^3/\text{s}$  (end of the closed section at Ag. Annis street). Then the capacity is increased from  $1,100\text{ m}^3/\text{s}$  (beginning of open section at Ag. Annis street) to  $1,400\text{m}^3/\text{s}$  (outfall).

### The river network of Athens basin

Athens basin is run by an extended river network. The biggest and most extended is Kifissos river network which is flanked by the smaller river networks of Podoniftis, Iridanos, Ilissos, Pikrodafni and Trachones (Geomithiki, 2021) (see image 4).

**Image 4: River network in Athens basin**

At the closed section of Kifissos river, one major (Podoniftis) and some minor streams (Kanapitseri, Chaidarorema, Masha, Rontaki and Liosion) are contributed, collecting rainwater from most of the area of the upper river network. (Geomithiki, 2021) (see image 5). These streams spring from Mt.Egaleo, Mt.Parnitha and Mt.Penteli, while part of the south river network of Podoniftis spring from Mt.Ymittos as well.

---

**Image 5: Upper river network of Athens basin (Kifissos and Podoniftis)**

The basin area of both river networks suffers of massive deforestation due to disastrous wildfires. Years 2021 and 2023, wildfires in Mt.Parnitha destroyed more than 140.000 acreages of forest, while year 2024 a wildfire in Mt.Penteli destroyed more than 85.000 acreages of forest. Under these conditions, the ability of ground to hold rainwater has been reduced rapidly and therefore massive volumes of water may expected in case of high precipitation in east and southeast slopes of Mt.Parnitha and to the south slopes of Mt.Penteli.

What appears as a critical issue, is the question of how sufficient the capacity of 400m<sup>3</sup>/s is (start of covered part in Three Bridges), to drainage massive volumes of rainwater during an extreme weather event and how possible is a weather event like this to happen.

### **Possible disasters – Past and Present**

Numerous studies have been published about possible floodings in Kifissos river. Most of them are focused on the lower part which has suffered extended fluvial floodings during the past. The ministry of Environment and Energy has introduced maps of possible disasters, drawing attention in parts of Athens basin (ypoka 2018) (see image 6) which are neighbored to Kifissos river.

## PROCEEDINGS

2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025

Image 6: Map of the maximum potential flood impact of river flows for a return period of T=1000 years

According to records, Athens basin has suffered numerous of disastrous flooding during the past. 14 November 1896, 23 November 1925, 22 November 1934, 2 November 1977, 21 October 1994, all these events with human losses and extended damages. But the worst disaster happened on Sunday 5th of November 1961. During that day, extreme weather conditions resulted in massive fluvial flooding in areas of Athens basin with 40 dead people and 4.500 homeless. Newspapers of that era, imprint the huge tragedy (see image 7).

Image 7: Greek newspaper “Ta Nea” - 7<sup>th</sup> November 1961

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Based on the previous events, the frequency of a disastrous flooding in Athens basin is around 6 times per century. In 21st century, we meet two (2) severe weather events, on 3 September 2002 and on 14 October 2021 (Ballos storm) – the last one was close to end as a very serious flooding disaster. During that day, numerous weather stations of the National Observatory of Athens measured precipitation higher than 110mm in 24 hours (image 8). The highest precipitation (181mm) was measured in Patisia while Kifissos river reached its max capacity - both in lower and upper part (1100m<sup>3</sup>/s and 400m<sup>3</sup>/s respectively).

**Image 8: Precipitation heights during Ballos storm - 14<sup>th</sup> October 2021**

### Valencia flooding and Athens interpolation

2 November 2024 a disastrous flooding took place in Valencia, Spain with 205 dead people, thousands of homeless and billions of euros in financial losses. This was the most severe flood disaster in Spain's modern history and one of the worst in Europe since 1970. This incident has come as a reminder to the vulnerability of places with major human interventions and how the changing climate produces extreme weather incidents. Having as a fact that these incidents are increased and observed in many places around the world, the question is what the consequences will be if this scenario happens in Athens basin.

Valencia basin is 6.393km<sup>2</sup> while Athens basin is 380km<sup>2</sup>. Both basins are run by river networks with similar characteristics but in a different scale. In Valencia, Turia river has a drainage capacity of 5.000m<sup>3</sup>/s while in Athens, Kifissos river has a drainage capacity ranged from 1.100 m<sup>3</sup>/s (lower bed) to 400m<sup>3</sup>/s (upper bed). During the storm, Valencia weather

## PROCEEDINGS

---

stations have measured precipitation of 500mm in a time duration of 6 hours while the maximum measured precipitation rate reached 184,6mm/h.

### Methodology

Two studies will be implemented for two (2) different catchment areas, with focus at the upper part of Kifissos river and before the covered part in Three Bridges (400m<sup>3</sup>/s drainage capacity). The first catchment area (Catchment 1) is the river network of Kifissos with a surface of 135km<sup>2</sup> (image 9) and the second catchment area (Catchment 2) is the combined river network of Kifissos and Podoniftis with a surface of 290km<sup>2</sup> (image 10).

**Images 9,10: Catchment areas of Kifissos river network and Kifissos-Podoniftis river network.**

Next step is to calculate the volume of water in catchment areas ( $V_e$ ) which is based on the following equation:

$$V_e = h_e \times S \text{ (Mimikou \& Mpaltas, 2012)}$$

where  $V_e$ : the volume of water,  $h_e$ : the precipitation height and  $S$ : the catchment area.

We proceed the calculations for both catchment areas and for precipitation height of 180mm.

$$V_{e \text{ (Catchment 1)}} = 2.430.000\text{m}^3 \text{ and } V_{e \text{ (Catchment 2)}} = 5.220.000\text{m}^3$$

Since the examined area is a combination of deforested, soft rock and hard rock mountain with urban and suburban areas, the runoff coefficient should be a weighted average of ~0.7 and therefore harvested water will be:

$$V_{e \text{ (Harvest Water in Catchment 1)}} = \sim 1.700.000\text{m}^3 \text{ and } V_{e \text{ (Harvest Water in Catchment 2)}} = \sim 3.650.000\text{m}^3$$

The precipitation height of 180mm is simulated in three rain duration scenarios for each catchment area (table 1,2): 30mm/hr (6 hours duration), 90mm/hr (2 hours duration) and 180mm/hr (1 hour duration).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

**Table 1: Catchment 1**

|            | Rain Duration | Precipitation rate (mm/hr) | Drainage (m <sup>3</sup> /s) |
|------------|---------------|----------------------------|------------------------------|
| Scenario 1 | 6 hours       | 30mm/hr                    | ~80m <sup>3</sup> /s         |
| Scenario 2 | 2 hours       | 90mm/hr                    | ~240m <sup>3</sup> /s        |
| Scenario 3 | 1 hour        | 180mm/hr                   | ~470m <sup>3</sup> /s        |

**Table 2: Catchment 2**

|            | Rain Duration | Precipitation rate (mm/hr) | Drainage (m <sup>3</sup> /s) |
|------------|---------------|----------------------------|------------------------------|
| Scenario 1 | 6 hours       | 30mm/hr                    | ~170m <sup>3</sup> /s        |
| Scenario 2 | 2 hours       | 90mm/hr                    | ~510m <sup>3</sup> /s        |
| Scenario 3 | 1 hour        | 180mm/hr                   | ~1015m <sup>3</sup> /s       |

Catchment 1 is exceeding the drainage capacity of 400m<sup>3</sup> for scenario 3, while Catchment 2 is exceeding the drainage capacity of 400m<sup>3</sup>/s for scenario 2 and scenario 3.

We proceed simulationg Scenario 2 of Catchment 2 for flooding event before the covered part of Kifissos in Three Bridges, using the software program Fast Flood. According to the simulation, extended areas of western suburbs of Athens will be affected by fluvial flooding. Most affected areas will be parts of Peristeri and Egaleo municipalities with extended damages in an area >3km<sup>2</sup> (image 11). These areas are described by narrow streets and many underground properties which increase the possibility of human losses.

**Image 11: Flooding simulation (Scenario 2 for Catchment 2 and for 1m height of full damage)**

---

### Solution

We have proved that in a weather event of precipitation rate  $> 90\text{mm/hr}$ , the harvested water from both catchment areas will cause fluvial flooding in west suburbs of Athens. To reduce the volume of drainage water from both catchment areas, we must proceed in drainage reduction of upper Kifissos river network. We focus on the join point of Floga stream, Varibobi stream and Kifissos river because in that point we have concentration of a big volume of waters before they proceed in the upper bed of Kifissos river (Geomithiki, 2021) (image 12)

**Images 12: Upper Kifissos river network**

Since there is no ability to increase the capacity of the covered part of Kifissos river, we should focus on water redirection to another basin. The only solution is the construction of a drainage tunnel starting from the joint point of Floga stream, Varibobi stream and Kifissos river ( $38^{\circ}03'59''\text{N}$ ,  $24^{\circ}45'01''\text{E}$ ) and exiting to Thriassio plane ( $38^{\circ}03'49''\text{N}$ ,  $23^{\circ}39'57''\text{E}$ ). The length of the tunnel will be approximately 8km, with 10m outer diameter (capacity  $\sim 300\text{m}^3/\text{s}$ ), with the trenching of the tunnel to be implemented in a depth 25 to 50m under Attiki Odos and the old railway network to Aspropyrgos Refineries (image 13).

**Image 15: Contour map of the trenching area**

Kifissos Drainage Tunnel (KDT) is a tested solution based on similar projects around the world (constructiondive.com, 2023) (halff.com, 2019). Having these projects as a reference, the cost of KDT is estimated in a total cost of 300 to 330 million euros (construction with TBM). It is a relatively expensive project, but necessary to avoid losses of lives and material damages of billions of euros like Valencia case (Reuters, 2024). Comparing to the solution of reforest to reduce runoff coefficient and therefor reduce the harvested water, an investment like KDT is preferable both in time and cost saving. It is estimated that for 50.000 acreages the cost is around 50 million euros and therefor the total cost of reforest the destroyed from wildfires area in Mt.Parnitha and Mt.Penteli is around 200 million euros. Additionally, even if the reforest could be implemented in one (1) year, which is impossible, it needs more than 10 years for a mature flora growth and under the condition of no new wildfire.

Following years are crucial, due to increased severe weather incidents like Daniel storm and due to massive deforestation of mountainous areas in Attica region - conditions that increase rapidly the possibility of a disastrous fluvial flooding in Athens basin. Investments in public works, environmental design and in scientific equipment are necessary to analyze data to reduce risk. The warnings are continuous, and the time is shortened.

**Abstract**

As researchers interested to territorial studies, the future of our cities is one of our most important concerns. Considering the strong transformative process in which the different accelerations are accompanied by the climate crisis, we should ask ourselves a question: how can we ensure that design truly acts with a sustainable approach and strives for a sustainable future?

The experience intends to fit into the framework of those proposals that try to ground sustainability, in addition to debate about it. More precisely, the idea is to materialize a transition from a design attitude that researches connections with the Agenda 2030 to an approach that integrates the sustainable development goals to the different design phases, from the analytical-interpretative to the strategic-prefigurative one. To achieve this idea, the research proposes to explore sustainability by searching a systemic vision, to experiment sustainability by assuming a transversal behavior and to interact with sustainability by working with a dynamic attitude.

The city of Mantua has been identified as a field of application where the idea can be linked to a transition process. Since 2023, the city has been involved in the European project HyMantoValley, an initiative of a broader program aimed at creating a hydrogen valley within the limits of the province. This context becomes an opportunity to reflect on new forms of energy production and distribution and to investigate the effects on the city and the landscape caused by these new relations. The case study intends to present a possible attempt to ground the different principles proposed by United Nations in a complex landscape.

**Key words:** cities of tomorrow, transition, sustainable future, integrated approach, new energy production, complex landscape.

**Striving for a sustainable future**

Over the past fifty years, great progress has been achieved in terms of theoretical knowledge, leading to a gradual growth of common awareness and consciousness around the topic of sustainability. Parallel to the theoretical understanding, however, the practical approach to the subject has not progressed to the same extent, remaining the experience of a few.

In the light of this, the study questions how to advance sustainable thinking in the context of planning the future of our cities, proposing a series of reflections in part useful for

## PROCEEDINGS

---

the growth of a common idea of sustainability, and in part intended to broaden the possible solutions for putting the topic into practice, moving from knowledge to know-how.

Today, those who work in the field of sustainability inevitably face two challenges: on the one hand, to act in continuity with a now consolidated concept, the ideals of which have been expressed since the second half of the last century; on the other hand, to undertake and trace new trajectories in order to operate coherently, taking into consideration the urgencies that the contemporary world offers. Following this, the paper proposes an initial in-depth examination with respect to the development of the concept of sustainability over time, which culminates in the proposal of a series of considerations that today we cannot overlook. The comparison with this subject requires first a marked propensity for connection aimed at recognising the links between different episodes, as tiles of a single representation, and then a certain dynamic ability aimed at understanding different perspectives, linked to the involvement of different institutions and territorial dimensions.

Taking the broader panorama as a starting point, the institutional body that has made the history of sustainability worldwide is the intergovernmental organisation of the United Nations, which, starting with the drafting of a common treaty in the 1940s, succeeded in outlining the prospects for the construction of the protection of human rights and the promotion of sustainable development. From this point of view, the 1970s-1980s represent a particularly decisive two decades. In 1972, the United Nations Conference on the Human Environment was organised in Stockholm, a convention that, for the first time, induced people to look at natural resources through a new, distinctly more responsible gaze, starting an educational process that is still ongoing.

Fifteen years later, in 1987, in the face of the growing need to understand and disseminate the impacts of mankind on nature, the “Brundtland Report” and what would later become the guiding definition for understanding sustainable development were born. The commission, chaired by Herlem Brundtland, president of the World Commission on Environment and Development, presented a document entitled “Our Common Future”, which shone a light on two important questions: the unsustainable production and consumption models against which the various countries of the North had gradually settled and the increasingly urgent need to adopt a balanced posture between development and the environment. This strategy that calls for integration and is called ‘sustainable development’ is described as follows in Chapter 2 “Towards Sustainable Development” of the report: ‘Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs’ (United Nations, 1987).

Following the guidelines formulated in these years, a long and dense debate began that would find a pivot point in the 2015 United Nations Summit. Among the various initiatives of this period it’s important to remember the “Rio de Janeiro Earth Summit” Conference of 1992, during which “Agenda 21” and other agreements were signed; the “Millennium Declaration” of 2000, through which eight goals to be concretely achieved by 2015 were defined; and finally, the “Rio+20” Conference of 2012, which, in continuity with the meeting on the environment and development held twenty years earlier, established the elaboration of goals for sustainable development.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The year 2015 takes on an exceptional role thanks to the emission of two important conventions: the “2030 Agenda”, a bold plan of action signed on 25 September in New York to work on the three dimensions of sustainable development, and the “Paris Agreement”, a treaty negotiated at the 21st Conference of the Parties to the United Nations Framework Convention on Climate Change (COP 21) aimed at combating ongoing climate change. Although the “Paris Agreement” represents a pivotal moment in the history of safeguarding our living environment, aiming at decreasing greenhouse gases and keeping the global temperature within 1.5 °C of pre-industrial levels (United Nations, 2015a), the “2030 Agenda”, with its broad horizons and highly integrated vision, constitutes the most ambitious design of all, capable of embracing all the other initiatives around it. A total of 17 Sustainable Development Goals and 169 targets that align the 193 UN member states to act in a cohesive and coordinated manner to achieve a better future, for people and for the planet.

Analysing the official text of the Agenda allows us to understand the true nature of the 17 Sustainable Development Goals and, above all, to identify those features with which we should relate in order to reduce the distance between our activities and the issue of sustainability: the SDGs are universal in nature, so they address the totality of countries without distinction of development; they have a plural nature based on the concept of integration and indivisibility that embraces the paradox of the single and the multiple; and, finally, they are designed to balance the three dimensions of sustainable development, the economic, the social and the environmental (United Nations, 2015b). The realization of human rights, gender equality and the empowerment of women, goals desired but not achieved through the MDGs, constitute three of the main interests defined by the Agenda, a program that recognises the inseparable link between the well-being of humanity and the health of the planet.

Over the years, since 2015, several COPs have followed one another to work in a synergical way around Goal 13 of the “2030 Agenda” related to contrasting climate change. The latest of these conferences is COP29, an event organised in 2024 in Azerbaijan on the basis of a sad awareness: the earth's temperatures are progressively rising and the one-and-a-half-degree threshold will most likely be crossed before the end of the century.

This journey through the stages of sustainability allows us to understand several issues: the presence of a constant delay with respect to the achievement of the set goals, which often require the development of new agreements capable of transforming the failure of previous stages into nourishment for new trajectories; the involvement and responsibility of the community in the design of a better future, in this sense the titles of the documents drafted over the decades are declined with respect to the first person plural; the growing desire to move from theory to practice, a concept further reiterated in 2015 through the expression “Transforming our world”, the title of the resolution adopted by the General Assembly for the communication of the “2030 Agenda”.

**Figure 1: reference framework on sustainability issues (author's elaboration).**

### **Renewable energy as a key element of sustainable development**

In the context of policies aimed at the sustainable development of our cities, the continuous advancement of technologies, together with the use that mankind makes of them to relate to the external environment, has made it increasingly necessary to raise awareness of certain specific issues.

From this point of view, the topic of energy production plays a central role. This theme acts as a link to the guidelines issued by the UN at global level and the directives developed within the European context. For ten years now, since the Paris Agreement on climate change, constraints have been defined that limit common action to protect the living environment and contrast climate change.

Following the dedication of the various member states' commitment to the “Paris Agreement”, in 2019 the European Commission launched the “Green Deal”, a package of initiatives with a strong strategic value that definitively set the European Union on a course towards a green transition process. More precisely, the agreement focuses on three fundamental pillars: ensuring secure and affordable energy supplies, designing an economic system around energy of an integrated and digitalized type, and shifting the focus to energy efficiency by working specifically on renewable energy production.

Today, energy from renewable sources is one of the key elements of European policy to succeed in combating ongoing climate change and achieving carbon neutrality by 2050. In fact, as data on the EU's official website show, 75 per cent of European countries' greenhouse

---

gas emissions come from energy production and use. To realize this ambitious decarbonisation process, Europe is increasingly promoting a shift from systems based on the use of fossil resources to systems based on the use of renewable resources.

The transformation process was strongly influenced by the difficulties that emerged with the covid-19 pandemic and by the plans that were defined following that period. Part of this overall design is the “NextGenerationEU”, a 750 billion euros temporary financial instrument, the largest in the history of the European Union, designed specifically to initiate a process of economic recovery of the parties and to trigger social proactivity in the face of possible unforeseen events.

If Europe responded to the pandemic crisis through the definition of the NGEU and the allocation of the “Recovery and Resilience Facility” (RRF), Italy in 2021 tried to look at this programme as an opportunity to rethink and invest in its own development, through the study of a long-term perspective condensed in the “National Recovery and Resilience Plan”. The plan consists of six missions developed in line with the major areas of intervention identified by the RRF Regulation, one of which is strongly focused on the energy issue.

The second mission, entitled “Green Revolution and Ecological Transition”, encourages the environmental transition of society and the economy with a strong push towards the use of different energy sources than in the past. This mission is in turn divided into several components, four in total, the second of which covers renewable energy, hydrogen, network and sustainable mobility.

The achievement of the strategic decarbonisation objectives highlighted by this component is obtained through the activation of five lines of reform and investment. The third line, entitled “Promoting the production, distribution and end uses of hydrogen”, focuses on promoting hydrogen as a strategic energy vector for rethinking the future of the productive landscapes that characterize our territories. Italy, in line with the European strategy, intends to pursue the production and use of hydrogen by “i) developing flagship projects for the use of hydrogen in hard-to-abate industrial sectors, starting with the steel industry; ii) favouring the creation of “hydrogen valleys”, leveraging in particular areas with disused industrial sites iii) enabling - through recharging stations - the use of hydrogen in heavy transport and in selected railway lines that cannot be electrified; iv) supporting research and development and completing all necessary reforms and regulations to enable the use, transport and distribution of hydrogen” (Italia Domani, 2021).

Although from a theoretical point of view this plan has all the potential to be identified as the most courageous political intervention of recent decades, a critical reinterpretation of the device with respect to the sustainability theme is considered useful.

Considering the more operational dimension, in fact, if all the targets were met by 2026, it would still not be enough to make it possible to achieve the SDGs by 2030 (ASviS, 2021). Among the most evident critical points: the absence of any reference to the seventeen goals, a fundamental element for achieving effective multi-level governance; the lack of quantitative and qualitative targets linked to socio-environmental aspects; a certain misalignment between the missions identified by the plan and the pillars of the guidelines designated by the European Union.

To confirm this, the Italian Alliance for Sustainable Development (ASviS) proposes a process of reclassification of the missions offered by the plan in relation to the goals of the

---

“2030 Agenda”, from which emerges an inadequately effective commitment to the energy transition planned by the European Green Deal (ASviS, 2021). Although positive innovations, such as the development of agrophotovoltaics or the creation of energy communities in small municipalities are identified, the realization of an effective decarbonisation process still seems distant.

### **A field to ground sustainability: the HyMantoValley project**

The considerable extension of industrial areas on Italian territory, and the high level of pollution produced by some of these, does not allow the weight of manufacturing activities to be ignored in relation to the environmental crisis we are experiencing. While the influence of these realities has reached extreme levels, it's also true that change is still possible.

The Energy Transition Commission, a group of experts from different sections of the energy sector, speaks of a “mission possible”: to achieve zero carbon emissions by mid-century to limit global warming by keeping temperatures as close as possible to 1.5 degrees (Energy Transitions Commission, 2018). Achieving zero carbon dioxide emissions in so-called ‘hard-to-abate’ sectors is technically feasible by investing in three complementary actions: limiting demand growth, improving energy efficiency, and finally, applying decarbonisation technologies. Among these, hydrogen plays a decisive role.

As experts point out, achieving the goal of zero CO<sub>2</sub> emissions by mid-century will require an increase in global hydrogen production from 60 Mt per year today to around 425-650 Mt by mid-century. Not only that, it will be essential to promote large-scale production of zero-emission hydrogen through one of these possibilities: electrolysis, which will become increasingly affordable as renewable energy prices fall; the application of carbon capture to methane reforming and the subsequent storage or utilisation of the captured carbon dioxide; and the reforming of biomethane, although it is unlikely to play a major role given the limited biomass resources (Energy Transitions Commission, 2018). In this perspective, the use of green hydrogen assumes a decisive role because through its characteristics it can convey a wide variety of advantages, primarily its strong integrability with renewable energy sources and other green energy technologies (Ficco et al., 2022).

From 2023, Mantua represents one of the Italian cities in which it is possible to experiment with the energy transition through the project of a Hydrogen Valley within the province's borders, which would avoid the emission of tons of CO<sub>2</sub> every year. The ambitious project aims to invest 60-70 million euros to achieve the following objectives: optimising the production and storage of renewable energy, its conversion into green hydrogen, its distribution, storage and multiple uses.

As described on the website of the Province of Mantua, the territorial body in charge of coordinating the project, in addition to the PNRR funds, the initiative is 70% supported through the European call for proposals I3 “Interregional Innovation Investment”, an investment facility managed by the European Innovation Council Executive Agency (EISMEA) dedicated to innovation within the European Regional Development Fund (ERDF). The project is based on the activation of a wide network of relationships involving 16 partners from 3 European countries besides Italy, i.e. Austria, Belgium and the Netherlands, and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

various stakeholders, such as public bodies, private entities, logistics companies, universities and research centres.

The Politecnico di Milano, with the detached territorial pole “Mantua Campus”, is one of these partners involved in the project to create a Lombardy Hydrogen Valley. In this initiative, the Politecnico, through the work of the interdepartmental Unesco Research Lab, accompanies the energy transition in an exceptional production context in which it is important to visualize change in a long-term logic.

Today's configuration of the Mantua production pole is the result of numerous transformations over time through very different drives and needs, not always interconnected and mutually coordinated. All this, together with the more recent development linked to the settlement of new and large companies operating in the transport and logistics sector, has made the area of interest rather fragmented, with scattered buildings and often incomplete urbanization works. The location of the area close to the historic city, a UNESCO heritage site, the proximity of the environmental system of the river Mincio and the lakes, the proximity of the disused industrial area, the presence of a supra-local infrastructural network in which the Valdaro river port stands out, are all aspects that allow the area to be considered as a complex landscape, a crossroads of heterogeneous flows and interests.

The group of Politecnico is in charge of the 3D monitoring of the area of interest, drafting the area's master plan and dealing with the architectural design of a Research Hub, the core of hydrogen-related innovation, where researchers, students and companies can work together to develop innovative solutions for the decarbonisation of the Po Valley. This in-depth study arises from the working group related to territorial planning and is based on the reflections that emerged before and during the realization of the master plan.

More precisely, planning activities are oriented towards achieving sustainability objectives through the integration of flows, production processes and research activities. With the awareness that the diffusion of new forms of energy on the territory often advances in a disconnected manner with respect to landscape valorization and protection policies (Laviscio, 2019), the research proposes an approach that intends to incorporate the theme of landscape quality in order to succeed in safeguarding the distinctive traits that make the Mantuan context recognisable to today's communities and tomorrow's generations.

### **Turning ideas into perspectives by exploring, experimenting and interacting**

The method we are experimenting within the Mantuan context is intended to be a small step towards the construction of an imaginary of future cities through the definition of a shared approach capable of integrating sustainability throughout the entire design process.

The main intention is to act with and for sustainability by moving from a more conceptual dimension, useful for increasing awareness around the topic, to a proactive one, able to ground the various objectives, anchoring them to the characteristics of a specific context. This means defining a process to move from a set of ideas, the result of an activity carried out mostly on a theoretical level, to a set of perspectives directly linked to action. In other words, if the concept of an idea is linked to a more abstract dimension, acting at a higher level without entering the merits of territorial confirmation, the concept of a perspective

## PROCEEDINGS

---

communicates a sense of trajectory, a focused direction, capable of tracing directions and projecting intentions inside the territory.

To do this, we suggest testing different ways of relating to sustainability at three stages of the project process:

- in the stage of consciousness, we propose an exploratory type of relationship with sustainability to be fully aware of the topic;
- in the stage of multiplicity, we propose an experimental type of relationship with sustainability to construct a diversified frame for the development of the topic;
- in the stage of progression, we propose an interactive type of relationship with sustainability to grow and increase along with the topic.

Consciousness, multiplicity and progression should not be interpreted as consequential steps in the design process but as challenges and urgencies that can be grasped along the way.

---

### *Explore by searching a systemic vision*

To explore sustainability, that is to examine it and reveal it in all its various shades, we suggest adopting a systemic view.

Using the systemic vision as a cognitive paradigm means looking at sustainability in its complexity, as ‘a fabric of heterogeneous constituents’ that confront us with the ‘paradox of the one and the many’ (Morin, 1993). Adopting this approach allows us first to keep the link between the particular and the general, or between detail and the whole, learning to discern the various components and recompose them in a renewed way, highlighting any criticalities and potentialities (De Giovanni, Sposito, 2020).

With reference to systemic design, this type of posture necessarily passes through the adoption of ‘framing’, a tool that allows to carefully analyse different information and organise it in a different way, activating a new perspective, often capable of generating new associations of meaning (Ryan, 2014). Selection, therefore, induces the creation of integrations and hierarchies of meaning without ever losing the importance and role of the whole, which is much more than the mere summation of the parts. Viewing always requires a broad pragmatism in linking together two different predispositions: the ability to grasp wide-ranging gazes and relationships and, at the same time, an aptitude for a detailed perspective (Gasparrini, 2015).

In the case of the HyMantoValley project, the adoption of a systemic vision served to define a critical and personal reading of the “2030 Agenda”, leading to the identification of a framework of strongly interconnected SDGs that find several points of contact with the initiative.

The different aims of the HyMantoValley project contribute synergistically to the achievement of target 7 related to clean and accessible energy by working mainly around two different perspectives: to increase the share of renewable energy in total energy consumption (target 7.2) and to increase international cooperation by facilitating access to clean energy research and technologies and promoting investment in energy infrastructure and clean energy technologies (target 7.a)

Pursuing an integrated logic, objective 7 can be accompanied by a series of other targets that collaborate towards the same general intent, in a direct or indirect manner. The focus on the theme of sustainable energy generates the involvement of a broader cluster of objectives described below: number 4, objective aimed at a quality, equitable and inclusive educational offer; number 6, objective that intends to guarantee the availability and sustainable management of water for all; number 8, objective aimed at lasting, inclusive and sustainable economic growth; number 9, objective aimed at building a resilient infrastructure and promoting responsible innovation and industrialization; number 11, objective that aims to make cities and human settlements inclusive, safe, long-lasting and sustainable; number 12, objective that intends to guarantee sustainable production and consumption models; number 13, objective linked to the promotion of multi-level actions to combat climate change; number 15, objective related to the protection, restoration and encouragement of sustainable use of the terrestrial ecosystem; last but not least, number 17, objective aimed at strengthening the means of implementation and renewing the global partnership for sustainable development.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The diversity of the network further reinforces the evidence of an inseparable bond between man and nature that requires synergic action on multiple fronts, balancing the three dimensions of sustainability: economic, social and environmental.

### *Experiment by assuming a transversal behavior*

To experience sustainability, or to concretely approach its plurality through immersive methods of verification and assessment, we suggest adopting a transversal behavior. The transversal, flexible, open approach is intended as a non-linear attitude that proceeds through gradual advances and possible intersections.

In this sense, transversality can be interpreted as multiscalarity, that is, the ability to move between the different scales of the project without losing continuity and coherence between the parts. Far beyond the proportion and metrics of the design, the scale refers to a model of reality, to a specific dimension and to a context with clearly distinguishable characteristics. Beyond any uniform need, the effort of cohesion between the different scales of the project concerns the contents, criteria and quality objectives of the project.

The theme of multiscalarity has its roots in the field of ecological sciences, knowledge in which the direct or indirect observation of facts and phenomena requires frequent “cross scaling” operations to distinguish the criteria and themes that each level of observation includes (Di Venosa, 2014). Michelangelo Russo, in one of the critical reflections on the notion of scale, states that “Thinking of the territory as a multiscalar assembly of complex and heterogeneous materials and phenomena represents a way to constantly cross the physical, material and visible components of space with the immaterial, invisible dimension of the subjects who are the active protagonists of space” (Russo, 2015).

To grasp this type of connection and relationship between extremely different components, it is not enough to limit the approach to the implementation of a process of enlargement or reduction of the view similar to an optical instrument, but rather it is appropriate to operate through a continuous action of “abstraction and verification” adequately articulated to restore the complexity of the different perceptive thresholds (Secchi, 2000).

In the HyMantoValley project, the multi-scale approach served to explore the area of interest at 360 degrees by observing the production hub through three complementary perspectives. The territorial scale (1:400,000-1:200,000) allowed us to frame the hub as one of the main industrial and infrastructural nodes of northern Italy, the landscape scale (1:200,000-1:25,000) allowed us to grasp the human-nature relationships that have guided the evolution of the place over time, highlighting the different identity values and the various connections, finally, the urban scale (1:25,000-1:10,000) served to understand the ongoing urban phenomena and to read the formal and functional aspects that distinguish the area of interest.

By focusing on different aspects of the area, the work around each scale has allowed us to emphasize a different connection with the objectives of the “2030 Agenda”. For example, in the context of the knowledge phase, the framework at the territorial scale has allowed us to emphasize the infrastructural network in which the Mantua hub is inserted and to underline the spatial relationship with the European planning of a hydrogen pipeline that longitudinally

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

crosses the entire Italian peninsula. This allows us to underline the involvement of a group of strongly interrelated SDGs among which the following stand out: objective 7 linked to obtaining clean energy, objective 9 linked to building a resilient and renewed infrastructure and objective 13 connected to the fight against climate change.

In addition, the transversal approach can be interpreted as cooperation or multi-sectorality, as well as the ability to work at the intersection between territorial entities that, despite their diversity, work for a common goal, the future of the territory. Unifying different structures, skills, views and sensibilities is not an easy task, but it is one of the necessary steps to allow a logical and cohesive operation. Public, private, research institutions, must necessarily converge in a single direction by offering their own point of view and their own information or tools for the construction of an effective overall vision (Qianjan, 2023).

In the HyMantoValley project, one of the main challenges was to be able to weave relationships with a wide range of subjects that offer different skills and communicate through diversified languages. Moving between the supra-local and the local, the project has collected the different projects of the Province and the Municipality with the aim of moving from a fragmented set of knowledge and strategies to an organized system of geographic information, superimposable and comparable in a GIS environment. More specifically, the main geographic data adopted for the creation of the representations derive from the Provincial Territorial Coordination Plan drawn up by the Province of Mantua, from the Regional Topographic Database provided by the Municipality of Mantua and from the navigation plan managed by the Interregional Agency for the Po River.

### *Interact by working with a dynamic attitude*

To interact or act mutually with sustainability, relating through actions that give rise to relationships of mutual influence, we propose a dynamic attitude. The dynamic attitude can be interpreted as a non-static and unconventional attitude towards the project, a dimension in which movement predominates on both a physical and conceptual level.

By breaking down the usual hierarchies and sequences that traditional planning has accustomed us to, this type of attitude calls for the adoption of an iterative process capable of putting together results in a progressive manner with the possibility of moving cyclically between the different steps. This means placing oneself in the conditions of repetition, evaluating a possible revision or reconsideration with respect to some steps already crossed, in the idea that this is one of the most effective ways to fully understand the complexity of the territory, made up of specificities, systems, multidimensional relationships, interdependencies, practices, flows, stories, people and much more (Russo, 2015).

The adoption of an iterative approach within the HyMantoValley project has allowed us to work synergistically within three operational phases that inform and redefine each other within a mutual relationship: the analytical phase responds to cognitive needs, the strategic phase deals with the need for staging, and finally, the applicative phase offers possible solutions to the needs of project implementation.

More precisely, the first phase intends to interpret the complexity of the territory through the understanding of its different resources and peculiarities, the second phase intends to prepare an overall vision for the territory through the development of an effective system of

## PROCEEDINGS

*2nd Open-Air Cities International Conference "Local & Regional Sustainable Development and Urban Reconstruction", Harokopio University of Athens, February 14-16, 2025*

---

objectives, finally, the third phase intends to prefigure the spatial effects of the strategy through the definition of site-specific design solutions.

This challenge, intersecting with the use of a multi-scalar approach, motivates the development of different project outputs that attempt the progressive experimentation of new expressive languages: some cartographies transfer the reading of the territory to the different temporal thresholds, other representations summarize the overall vision associated with the development of the production hub, finally, some graphic works describe the different design solutions.

Furthermore, the dynamic attitude can be interpreted as the ability to move between a multiplicity of options and alternatives. This implies first the abandonment of an exclusive vision aimed at reaching a single scenario and, secondly, the development of an open and flexible procedural attitude that allows to look at reality in a more complex and responsible way. The evaluation of alternatives implicitly includes a series of attentions aimed at the landscape and the people who, depending on the hypothesized transformations, will collect different outcomes and impacts.

In the specific case of HyMantoValley, the transition between the knowledge framework and the implementation phase of the Research Hub was addressed by identifying 9 possible locations, i.e. areas differently attractive for the placement of the research center. The mapping phase was supported by an investigation phase aimed at developing an information form that, evaluating qualitative and quantitative aspects, offers a judgment of suitability and interest with respect to the specific site. Wanting to define a project that advances progressively considering multiple possible futures, the basic idea is not to converge towards the definition of a single masterplan but to prepare different alternatives that verify the possible scenarios that the best locations are able to generate.

### **Approach & thinking**

The research activity within the HyMantoValley initiative, although not yet concluded, constitutes an important testimony to the usefulness of a strongly integrated approach in the construction of an imaginary for the future of our cities.

Reflecting on the various experiments underway, the contribution promotes research as a possible reference to ground sustainability by offering a highly integrated model resulting from the fusion of different attentions and approaches: a systemic vision, a transversal behavior and a dynamic attitude.

To proceed in this direction, a change of perspective is essential, achievable only and exclusively working on awareness. Recovering the words of Edgar Morin, a French sociologist and philosopher known for having associated the theme of complexity with today's society, what we really need is "a radical thinking (which gets to the root of problems), a multidimensional thinking, and an organizational or systemic thinking" (Morin, Kern, 1999). The thinking described by Morin can reassemble the disjointed and compartmentalized parts, it is able to respect diversity while recognizing its unitary dimension and it is able to grasp interdependencies.

If to obtain an integrated approach, it is appropriate to adopt a radical thought, it is equally evident how the practical dimension is strongly connected to the sphere of the

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

intellect and, due to mutual dependence, how operational progress almost always derives from conceptual efforts.

In this direction that sees sustainability as a shared work site, the construction of a unitary approach appears to be a particularly difficult challenge. Thinking about sustainability, a particularly diversified, divided, sometimes fragmented dimension emerges: seventeen objectives, more than one hundred and fifty targets, countless subjects involved between the public and private spheres, an infinity of interests and needs, a wide range of initiatives spread throughout the world, different skills and attitudes, etc. The perspective becomes progressively more complex when we try to associate all this with the precariousness that we experience today in our cities due to the innumerable risks, natural and anthropic, to which settlements are subjected.

Despite the many doubts, the first step to try to trigger widespread change is to escape the staticity that concern for the future entails, freeing oneself from the defensive logic of what should not be done to become part of a proactive dimension that does not demand certainties but offers possible solutions to stimulate a sustainable metamorphosis of our cities (Gasparrini, 2017).

“Grounding sustainability”, the claim underlying the Mantua initiative, underlies precisely this idea: today is no longer the time for reflection but the moment to act and consciously project concrete proposals on our territory for a better future.

### DECODING EUROPE’S ‘RENOVATION WAVE’ ENERGY STRATEGY: REAL ESTATE SHIFTS FOR SUSTAINABLE CITIES

**Vardopoulos Ioannis**

*Foundation for Mediterranean Studies - MeDiterranea, Greece*

[ivardopoulos@post.com](mailto:ivardopoulos@post.com)

**Poli Maria**

*University of West Attica, Egaleo, Greece*

[mpoli@uniwa.gr](mailto:mpoli@uniwa.gr)

#### Abstract

The European Union’s Renovation Wave initiative, an integral pillar of the European Green Deal, endeavors to fundamentally transform Europe’s building stock in pursuit of climate neutrality, social equity, and resilient economic growth. To double the annual rate of energy renovations by 2030, the initiative addresses the pressing environmental challenges posed by buildings, which are responsible for nearly 40% of Europe’s energy consumption and 36% of its greenhouse gas emissions.

By synthesizing insights from key research and regulatory frameworks into an incisive SWOT analysis, this paper elucidates the Renovation Wave’s far-reaching implications for the real estate sector, underscoring its transformative potential and inherent complexities. The findings reveal substantial strengths, including cohesive regulatory support, a robust funding apparatus, and a strong commitment to digitalization and inclusivity, thus positioning the real estate sector as a linchpin in the EU’s green transition. Nevertheless, critical barriers - financing deficiencies, skill shortages, and marked regional disparities- pose significant constraints on the initiative’s broader efficacy. Despite these obstacles, the Renovation Wave presents unparalleled opportunities, from enhancing property values and catalyzing green job creation to fortifying climate resilience within the sector.

This study concludes that realizing the Renovation Wave’s ambitions will necessitate coordinated, strategic action among policymakers, industry stakeholders, and regional authorities. Addressing these challenges is vital to unlocking the initiative’s transformative potential, positioning the EU as a global exemplar in sustainable building practices and climate-adaptive urban development.

**Abstract**

This study investigates end-users perceptions of innovative construction solutions, specifically thermal insulation materials. Initially, a literature review was applied to categorize insulation requirements into economic, environmental, social, and technical. Through the review, various drivers and barriers to the adoption of innovative materials within these categories were also identified.

To gather further insights, a survey targeted end-users across several European countries, particularly those participating in the SNUG European project (<https://snugproject.eu/>, Horizon Europe, 2023-2027). Conducted in March 2024, the online questionnaire received 115 responses from 12 countries, with Spain, Austria, Greece, and Portugal contributing the most responses. The respondents mainly consisted of architects, engineers, building occupants, and private homeowners, most of whom reported either high or average knowledge regarding insulation materials.

Survey findings revealed that the most essential criteria for insulation materials were cost efficiency, durability, energy efficiency, health impacts, the release of harmful substances, and thermal performance. Conversely, aesthetics, bio-based materials, biodegradability, and weight/density were deemed least necessary. In addition, the criteria for selecting insulation materials were ranked in terms of importance as technical, economic, environmental, and social.

Additionally, an analysis was performed to identify the differences based on the knowledge level of the participants (low, average, high). All groups rated energy efficiency and health impact highly, while weight/density and bio-based materials ranked lower in importance in all three groups. Statistically significant differences were noted, with low-knowledge participants regarding biodegradable materials and sustainability as less critical, whereas the high-knowledge group undervalued aesthetics.

The findings aim to guide building component manufacturers in developing innovative products that meet user needs and preferences.

#### Abstract

Biomethane (bioCH<sub>4</sub>) is expected to significantly contribute to the EU's energy decarbonization efforts by reducing reliance on natural gas imports and enhancing the share of renewables across various sectors. While most EU countries have the necessary gas infrastructure and regulatory frameworks, few facilitate upgrading biogas to bioCH<sub>4</sub> for grid injection. The EU Green Deal and "Fit for 55" package present new opportunities for expanding bioCH<sub>4</sub> deployment, but effective national policies must align with industrial capacities and market conditions to foster development and investment.

The GreenMeUp Horizon project (2022–2025) aims to enhance bioCH<sub>4</sub> market uptake in Europe's energy and transport sectors by improving policies in less-developed markets. The initiative brings together the European Biogas Association, experienced countries (Germany and Italy), and target nations [Greece, Spain, Poland, Latvia, Estonia, Czechia, and the Danube Region (including parts of Hungary, Romania, and Serbia)], along with Mission Innovation Countries (USA, Canada, China, Brazil, and India) to share best practices and insights. This collaborative effort aims to inform and refine policies in target countries, ultimately fostering a robust bioCH<sub>4</sub> market.

The project has explored social perspectives in all target countries, starting with a literature analysis of existing research, which was applied to develop a theoretical model presenting the determinants of consumers' perceptions. Based on the conceptual model, a questionnaire was formulated, focusing on consumers' interpretations and perspectives on bioCH<sub>4</sub> for energy and transportation purposes. Following, a survey was performed in 11 European countries (November 2024); 200 responses were collected per country with the collaboration of a surveying company. The topics addressed included a) knowledge and awareness, b) perceptions, attitudes and behaviour towards using biomethane-based fuels, c) willingness to pay for different applications of biomethane-based fuels, and d) perceptions on local acceptance of biomethane-producing facilities.

The results of this study will enable the development of policies targeted at the market uptake of bioCH<sub>4</sub> and the creation of tools addressing citizen misconception issues.

## **Abstract**

*In recent years, research interest in anthropogenic impacts on the environment has been particularly intense, as evidenced by the range of empirical research related to climate change. Climate change and especially its negative effects is a field of continuous research and study. This research examines how economic growth, consumption of energy resources and population affect the quality of the environment in the case of Greece employing appropriate econometric techniques. Specifically, using an ARDL model, the long- and short-term effects of these variables on environmental quality, measured by carbon dioxide emissions, are examined. Carbon dioxide (CO<sub>2</sub>) is the most important anthropogenic greenhouse gas. The findings reveal that economic growth and energy consumption have a positive and significant impact on environmental degradation. These results underline the urgent need for sustainable development policies that promote economic growth while mitigating environmental damage. These policies should aim to reduce CO<sub>2</sub> emissions and focus on increasing energy efficiency.*

**Key words:** *climate change, energy consumption, environmental quality, ARDL*

## **1. Introduction**

The relationship among economic growth, energy consumption and environmental quality has become increasingly significant in the context of global climate change and sustainable development goals. In recent years climate change poses a significant threat to the ability to maintain economic prosperity. In this context many researchers are seeking evidence on how economic growth impacts environmental quality across different stages of development and what the relationship is between energy consumption patterns and environmental degradation. There is not always a clear path between seemingly opposite directions. Energy consumption is a crucial factor, as it drives economic growth and is a major source of environmental pollution, especially through fossil fuel combustion like coal and oil. Non-renewable energy sources are primarily associated with high greenhouse gas emissions.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The Greek economy is highly dependent on fossil fuels and therefore highly vulnerable to the risks stemming from it (IEA, 2023). However, we should not lose sight of the fact that significant efforts have been made in recent years to move to more environmentally friendly energy sources. Greece has adopted a national climate law that sets ambitious targets for reducing greenhouse gas emissions. This law aims for climate neutrality by 2050 in accordance with European Green Deal.

The case of Greece is extremely interesting because the Greek economy suffered an unprecedented economic debt crisis for a country in the developed world that set it back several years with very significant repercussions on the productive and social fabric. However, the restoration of normality did not last long, since the Covid 19 pandemic broke out very soon. In this light, the new data allows us to study the correlation between economic growth and environmental quality in abnormal conditions.

## 2. Literature Review

The cornerstone of any new study is the Environmental Kuznets Curve (EKC). The Environmental Kuznets Curve (EKC) hypothesis suggests an inverted U-shaped relationship between economic development and environmental degradation. The main idea is that as economies expand, they typically consume more energy, often leading to increased pollution and resource depletion, especially in early stages and this pattern reverses as income rises, due to adoption of cleaner technologies and stricter regulations, potentially leading to improvements in environmental quality. Initial studies by Grossman and Krueger (1991) found that economic growth initially leads to environmental deterioration, but beyond a certain income threshold, environmental quality begins to improve. Although subsequent research has supported these findings, other results are challenging this hypothesis. Stern (2004) argues that while some pollutants follow the EKC pattern, others, particularly global pollutants like CO<sub>2</sub> emissions, may not demonstrate the same relationship.

Early studies primarily focused on total energy consumption and soon after research interest expanded to include different types of energy, such as electricity, nuclear, and renewable energy, recognizing that not all forms of energy have the same impact on growth (Payne, 2010). Energy consumption plays a very important role in environmental degradation. Evidence from developing countries indicated that rapid economic growth leads to higher energy consumption due to high participation of carbon and oil in the energy mix exacerbating environmental degradation (Kais et al., 2016). Apart from EKC analysis, many research studies have been conducted in related areas, including various aspects forming the energy consumption, CO<sub>2</sub> emissions – growth nexus. Studies employ various methods, including panel data, time series analysis, and econometric techniques like OLS, fixed effects, and ARDL. Acaravsci and Ozturk (2010) by applying an ARDL model on data from 19 European countries, found in many cases significant long-run relationship between real GDP, CO<sub>2</sub> emissions and energy consumption. Similar conclusions were reported by Menyah et al (2010) for Saudi Arabia. Manu et al (2017) using simple OLS analyzed the impact of energy consumption and economic growth on CO<sub>2</sub> emissions. Energy consumption patterns significantly influence environmental quality through various channels like direct emissions from fossil fuel consumption and land use changes for energy infrastructure. Studies by

---

Zhang and Cheng (2009) demonstrate strong causal relationships between energy consumption and carbon emissions in developing economies.

Population growth rate is another factor to be considered. The empirical analysis at the aggregate level demonstrates the country-specific impact of population density on CO<sub>2</sub> emissions, emphasizing the need for policies that address the environmental impacts of population growth (Ohlan, 2015). Sulaiman et al (2018) added population growth rate to the equation, but there was no evidence of long-term relationship between population growth and CO<sub>2</sub> emissions. Population density also plays a crucial role in environmental quality. Higher population density can lead to increased demand for resources and energy, resulting in higher emissions and greater environmental degradation. The combined approach to investigate the dynamic relationships among economic growth, environmental degradation, and energy consumption has provided valuable insights. Studies using time series analysis and panel data analysis have explored the relationship between environmental pollutants, renewable and fossil energy consumption, and economic growth (Bölük & Mert, 2015). These analyses are crucial for formulating policies that balance economic development with environmental sustainability.

### 3. Methodology

#### 3.1 Data analysis

Greece’s annual data employed by this study cover the period from 1990 to 2018 and the main source is Energy Institute (2024), Statistical Review of World Energy 2024 and the World Bank. This time period covers a period with extremely interesting features, like the fiscal crisis that the country has experienced since 2010 and the period of Covid 19 lockdown. CO<sub>2</sub> emissions are modeled as a dependent variable, while economic growth, energy consumption and population growth rate as independent. More details on those variables exist in Table 1.

Table 1. Data variables details

| INDICATOR_NAME              | SOURCE NOTE                                                                                                                                                                                                                                                                                                                                                                                       | SOURCE_ORGANIZATION                                                       | Unit                 |

### 3.2. Empirical model

This study employs an ARDL model. In recent years, ARDL models have gained increasing popularity in econometrics and environmental research due to their flexibility and ability to handle small sample sizes effectively. These models are particularly useful for examining the dynamic relationships between variables over time, allowing for both short-term and long-term analysis. By incorporating lagged variables, ARDL models can disentangle the complex interactions between economic growth, energy consumption, and environmental quality, providing more robust and insightful results. One very important advantage of this model is that the order of integration of the variables is not so important. Variables can be of any order. They can be  $I(0)$ ,  $I(1)$  or mixed. The only restriction is that they cannot be greater than  $I(1)$ . The ARDL( $p, q$ ) model is represented by the following general equation:

$$\ln CO2_t = \alpha_0 + \sum_{i=1}^p \alpha_i \ln CO2_{t-i} + \sum_{j=0}^q \beta_1 \ln GDP_{t-j} + \sum_{j=0}^q \beta_2 \ln ENC_{t-j} + \sum_{j=0}^q \beta_3 \ln POP_{t-j} + \epsilon_t \quad (1)$$

To investigate the long run relationship among the variables we will apply the ARDL bounds test approach to cointegration (Pesaran et al., 2001) and use critical values for small samples (Narayan, 2005). By reparameterization of the ARDL equation into an unrestricted error correction model we have the following equation which enables the analysis of long and short run relationship:

$$\Delta CO2_t = \alpha_0 + \pi_{CO2} CO2_{t-1} + \pi_{GDP} GDP_{t-1} + \pi_{ENC} ENC_{t-1} + \pi_{POP} POP_{t-1} + \sum_{i=1}^{p-1} \phi_i \Delta CO2_{t-i} + \sum_{j=0}^{q_1-1} \beta_j \Delta GDP_{t-j} + \sum_{j=0}^{q_2-1} \gamma_j \Delta ENC_{t-j} + \sum_{j=0}^{q_3-1} \delta_j \Delta POP_{t-j} + \epsilon_t \quad (2)$$

Where,  $\Delta$  is the first difference operator,  $\alpha_0$  is the intercept term,  $\pi_{CO2}, \pi_{GDP}, \pi_{ENC}, \pi_{POP}$  are the long-run multipliers,  $\phi_i, \beta_j, \gamma_j, \delta_j$  are the short-run dynamic coefficients,  $p$  is the lag length for the dependent variable and  $q_1, q_2, q_3$  the lag lengths for the independent variables. The bounds test is based on F-Statistics. The null hypothesis  $H_0 : \pi_{CO2} = \pi_{GDP} = \pi_{ENC} =$

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

$\pi_{POP} = 0$  is tested against the alternative. The calculated F-statistic is compared to two sets of critical values, the Lower bound, which assumes all variables are  $I(0)$  and the Upper bound, which assumes all variables are  $I(1)$ . Critical values are provided in tables by Pesaran, Shin, and Smith (2001). There are three possible outcomes, first if F is greater than the upper bound, we reject the null hypothesis, which eventually means that there is evidence of cointegration. If F is lower than the lower bound, we fail to reject the null hypothesis. There is no evidence of cointegration. In case F falls between the two bounds the test is inconclusive.

### 4. Empirical Results

Investigating statistical data through Exploratory Data Analysis (EDA) is a critical preliminary step in econometric analysis that involves summarizing, visualizing, and interpreting the main characteristics of a dataset. The primary objective of EDA is to uncover patterns, detect anomalies, test assumptions, and generate hypotheses about the relationships between variables. In Table 2 we present a descriptive statistics summary for all variables employed in this study. There are no missing values in our dataset.

Figure 1 presents the trends in CO2 emissions, energy consumption, GDP, and population in Greece from 1990 to 2022. It visually illustrates the relationships and changes among these variables over time, highlighting significant economic and environmental events and their impact on each parameter. From the graphic illustration we observe that in 2010, a year that coincides with the beginning of the fiscal crisis in the country, there was a significant decline in carbon dioxide emissions and energy consumption. Greece's GDP follows the same path. The economic turmoil led to reduced industrial activities and energy use, contributing to lower carbon emissions. Greece's GDP mirrors the trend of CO2 emissions and energy consumption. Figure 1 demonstrates the interconnected nature of environmental and economic factors in Greece, highlighting how economic crises can lead to significant reductions in pollution and energy usage.

In Figure 2 a correlation analysis presents the correlation coefficients between variables employed. These figures show the relationship among CO2 emissions, energy consumption, GDP, and population. The correlation coefficients provide insight into the strength and direction of these relationships. There is strong positive correlation between GDP and energy consumption, and as expected energy consumption and CO2 emissions, suggesting that higher economic activity is associated with higher carbon emissions. The first step is to test our data for stationarity using the augment Dickey Fuller test (Dickey & Fuller, 1981).

Although ARDL does not require checking the integration order of variables, the unit root test was conducted to ensure no variable exceeded 1 and to verify the methodology's appropriateness. The presence of stationarity of  $I(2)$  would force us to ender the methodology. Pesaran et al. (2001) developed the ARDL method assuming all variables are  $I(0)$ ,  $I(1)$ , or mixed;  $I(2)$  variables would invalidate it. Therefore, these tests were performed, and the results are in Table 3. Results reveal that only population growth (PG) is stationary at level, that is  $I(0)$  and all the other variables, energy consumption (lnEC), economic growth (lnGDP) and CO2 emissions (lnCO2) are stationary at first difference, that is,  $I(1)$ . Therefore, considering the mix order of integration of the variables, the ARDL approach is the most fitted methodology rather than the standard or conventional cointegration approaches.

---

Optimal lag selection is a critical step in time series analysis, particularly when building models like ARDL (Autoregressive Distributed Lag) or VAR (Vector Autoregression). The goal is to determine the appropriate number of lags for the dependent and independent variables to ensure the model is well-specified, avoids overfitting, and captures the true dynamics of the data. Including too many lags can lead to overfitting, where the model captures noise instead of the underlying relationship on the other side, including too few lags can lead to underfitting, where the model fails to capture important dynamics in the data.

The optimal lag length for the dependent and independent variables was selected using the Akaike Information Criterion (AIC), which balances model fit and complexity. A maximum lag order of 3 was chosen based on the frequency of the data and prior studies. The AIC was computed for all possible lag combinations, and the model with the lowest AIC value was selected as the optimal specification, as shown in Table 2. The lag selection process identified an optimal lag of 2 for the dependent variable (lnCO<sub>2</sub>). For the independent variables, the optimal lags were 3 for lnGDP, 2 lags for POP and 0 for lnENC.

Having identified the optimum lag length in the previous section, we will estimate now long-run relationship among the variables by applying OLS. The null hypothesis of no cointegration was tested against the alternative. Pesaran et al., (2001) provide two sets of critical values, which form two bounds. The lower bound assumes that all variables are I(0) and the upper bound that all variables are I(1). If the computed F-statistics are greater than the upper bound, we reject the null hypothesis of no cointegration and if it is below the lower bound, we fail to reject the null hypothesis. Between the bounds, the test is inconclusive. The result of this test is presented in Table 5. As the F-statistics (12,9542) lie above the upper bound at 5% and 10%, these indicate that the null hypothesis could not be accepted. As such, a long-term cointegration relationship exists at all levels. Results for the ARDL model and diagnostic checks are represented in Table 6.

ARDL model's diagnostic tests indicate that all assumptions are statistically significant at level 5%. Favorable results indicate a robust and reliable model. This means that the residuals are free from autocorrelation and heteroscedasticity, are normally distributed, and the model passes stability tests. Consequently, the estimated coefficients, representing both short-run and long-run relationships, can be interpreted with a high degree of confidence, suggesting that the model accurately captures the dynamic interactions between the variables under analysis. The validation of these diagnostic tests is crucial for ensuring the validity of any subsequent inferences or policy recommendations derived from the model.

CUSUM and CUSUMSQ charts are presented in Figures 3 & 4. It is important that the blue line does not cross the 5% critical bounds (red and the green line) in any chart. From the charts we can infer that there is not issue of recursive residuals in terms of mean (CUSUM chart) and in terms of variance (CUSUMSQ chart).

After establishing a cointegration relationship among the variables, the long-run model in Equation 2 is estimated to obtain the long-run coefficients as reported in Table 7. The results reveal that economic growth is positive and significant at 5% level in determining CO<sub>2</sub> emissions. A 1% increase in economic growth will cause a 0.65% increase in CO<sub>2</sub> emissions. Population growth and energy consumption have a positive sign and are statistically significant at 5% level.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

Short run results are reported to table 6. Most coefficients are statistically significant at level 5% except dLNGDP and dPG. GDP exhibits a positive sign but is not statistically significant, energy consumption is positive and statistically significant, population growth and its lag are negative. The error correction term (ECT) which measures the deviation from a long-run equilibrium between variables is negative and significant, which is expected to satisfy econometric requirements.

Table 2. Descriptive Statistics Summary

|          | CO2    | GDP    | ENC    | POP   | lnCO2 | lnGDP | lnENC |

Table 5 - Bound Test Results

Testing for existence of a level relationship among the variables in the ARDL model  
\*\*\*\*\*

|             |                 |                 |                 |                 |
|-------------|-----------------|-----------------|-----------------|-----------------|
| F-statistic | 95% Lower Bound | 95% Upper Bound | 90% Lower Bound | 90% Upper Bound |
| 12.9542     | 3.8177          | 5.1388          | 3.0558          | 4.2425          |

|             |                 |                 |                 |                 |
|-------------|-----------------|-----------------|-----------------|-----------------|
| W-statistic | 95% Lower Bound | 95% Upper Bound | 90% Lower Bound | 90% Upper Bound |
| 51.8167     | 15.2709         | 20.5552         | 12.2231         | 16.9699         |

\*\*\*\*\*

If the statistic lies between the bounds, the test is inconclusive. If it is above the upper bound, the null hypothesis of no level effect is rejected. If it is below the lower bound, the null hypothesis of no level effect can't be rejected. The critical value bounds are computed by stochastic simulations using 20000 replications.

## 5. Conclusions

This study investigates the impact of economic growth, energy resource consumption, and population on environmental quality in Greece using appropriate econometric methods. Specifically, an ARDL model is employed to analyze the long- and short-term effects of these variables on environmental quality, as indicated by carbon dioxide emissions. Carbon dioxide (CO<sub>2</sub>) is the most significant anthropogenic greenhouse gas. The results demonstrate that all variables under consideration economic growth, energy consumption and population growth have a positive and substantial effect on environmental degradation in the long run. In the short run only energy consumption seems to explain CO<sub>2</sub> emissions. These findings highlight the imperative need for sustainable development policies that foster economic growth while mitigating environmental damage. Such policies should aim to reduce CO<sub>2</sub> emissions and prioritize enhancing energy efficiency.

## Abstract

IMF indicated soaring metal prices, as cleantech firms are witnessing a meteoric rise in demand, and even dirty energy firms are changing their stance towards clean energy. Shock transmission (both positive and negative) is plausible as the world is chasing a net-zero emissions scenario. Therefore, we have investigated the top nine renewable energy companies globally with related metals (Nickel, Copper, Cobalt) from 3rd January 2017 to 3rd January 2022. This period also involves pre-Covid, Covid 1st Wave, Delta and Omicron. Our approach was QVAR, as suggested recently by Gabauer (2021), which is a logical extension of the initial connectedness approach proposed by Diebold and Yilmaz (2014). We found several outcomes. Shock transmission is happening from both cleantech and dirty energy firms to metals. Connectedness (shock transmission) is increasing in tails. Moreover, connectedness in the lower upper quantiles is asymmetric, with clean energy companies tending to transmit positive shocks to metals. Therefore, mean-based connectedness could be ruled out. Metals such as Nickel, Cobalt, and Copper emerged as the net receivers of shocks. The firms with higher market capitalization producing clean energy emerged as significant net transmitters of shocks (Enphase, Orsted and VWS). The total Connectedness Indices (TCIs) are heterogeneous over time. TCI sharply increased immediately after Covid-19 fallout and remained at a relatively higher zone than pre-Covid levels. Wind energy firms (SSE and Orsted) emerged as the net transmitter among all pairwise directional connectedness; furthestmost wind energy firms (SSE, ED and EDP) emerged as the moderate net receiver of shocks. This research provides many inputs towards the wind energy sector for researchers, practitioners and policymakers.

## Abstract

Urban energy transition is a critical response to the urgent challenges of climate change and urbanization. Building-Integrated Photovoltaics (BIPV) emerge as a transformative solution, integrating solar energy generation into the buildings and urban infrastructure of cities. BIPV systems not only provide renewable energy but also enhance the functional aspects of buildings, making them a key component in sustainable urban development.

BIPV technology enables the integration of photovoltaic materials into building elements, such as roofs, façades, windows, and shading devices. This integration allows buildings to generate their own electricity while serving essential structural functions, such as weather protection and thermal insulation. By utilizing available surfaces without requiring additional land, BIPV maximizes space efficiency, which is particularly crucial in densely populated urban environments. The dual functionality of BIPV systems contributes to reducing overall energy consumption and greenhouse gas emissions, aligning with global sustainability goals. The potential of BIPV is significant; in Europe, 36% of energy-related greenhouse gas (GHG) emissions and around 40% of energy use are attributable to buildings. In response to climate change there is an urgent need to curb emissions and mitigate their environmental impact. By harnessing solar energy on-site, BIPV can significantly mitigate this impact. Moreover, BIPV can enhance energy independence for urban dwellings by reducing reliance on traditional power grids and enhancing clean air and urban resilience.

Technological advancements in BIPV have led to improved efficiency and design flexibility. The development of new materials and designs has made BIPV systems lighter and more adaptable to various architectural styles, facilitating broader adoption across diverse urban contexts. Regulatory frameworks are less advancing, and further evolution is needed to support the integration of BIPV in urban planning, supported by policies promoting energy efficiency and renewable energy adoption. With the increasingly recognition of the role of BIPV as a viable solution for achieving net-zero buildings and positive energy districts, initiatives such as the European Union’s Renewable Energy Directive encourage Member States to facilitate local renewable energy projects, including BIPV installations. As cities strive to reduce their carbon footprints and enhance resilience against climate change, the

---

widespread adoption of BIPV will be essential. In this context, BIPV's efficiency and longevity are two critical parameters in the wider BIPV deployment and will be discussed synergistically to greenery and towards urban decarbonization.

**Key words:** Building Integrated Photovoltaics (BIPV), BIPV Longevity, Urban environments, Energy transition

The research work is implemented in the framework of H.F.R.I call “Basic research Financing (Horizontal support of all Sciences)” under the National Recovery and Resilience Plan “Greece 2.0” funded by the European Union – NextGenerationEU (H.F.R.I. Project Number: 14812).

**COGNITIVE BACKGROUND OF THE RELATIONSHIP BETWEEN  
AUTONOMOUS VEHICLES AND SUSTAINABLE MOBILITY: A CASE  
STUDY OF GREEK DRIVERS**

DOI: 10.26341/issn.2241-4010-2025-9a-5-K02059

***Abstract***

*The research that is presented concerns the investigation of the background of the cognitive familiarity, regarding the matter of the relationship between autonomous vehicles and Sustainable Mobility. Both the existing background knowledge and the gaps of knowledge are approached in detail, concerning the sustainable side of the future use of autonomous driving of vehicles.*

*More specifically, research which targets the group of Greek drivers is used as a case study. Within the initial theoretical part of this research, the necessary review of related studies and methods as well, is conducted, so as to link this research topic with the much wider, existing body of research of the international scientific community. Moreover, on its main theoretical part, the conceptual definition of autonomous vehicles and sustainable mobility, as well as other relative terms that lay the initial foundations for understanding, are mentioned for deeper understanding.*

*Furthermore, the past and current development of some relevant proposals and applications is presented with the purpose of making the suggestions for their future use more understandable. The following case study is specialized in the statistical population of car drivers in the country of Greece, who are approached by a representative sample of some statistical units in the context of primary data collection.*

*Subsequently, based on their answers and thoughts about the topic in question, the cognitive background regarding the contribution of autonomous vehicles to sustainable mobility is delineated. Finally, specific helpful conclusions are drawn regarding the potential inclusion of autonomous vehicles, related to sustainability, in real road networks, as well as suggestions that have to do with future research work on the topic.*

***Key words:*** *autonomous vehicles, sustainable mobility, sustainable development.*

**Introduction**

Nowadays, there has been an increasing number of research and applications that has to do with the utilization of advanced digital technologies towards the technical enhancement of diverse types of vehicles, based on the principles, ideas, and practices of Sustainable Development. Relative practices are aligned with the universal shift on behalf of governments, the car industry and other stakeholders towards the protection of humanity's resources for the

---

future and indeed on a global level. This is an essential core element that is highlighted on the Sustainable Development agenda, which was redefined with the publication of the "Our Common Future" in the year 1987, a significant publication with regards to environmental thinking in general. Funded by the United Nations, the World Commission on Environment and Development, led by Brundtland H. G., called for the reorganization of institutional stakeholders at a global, national, and local level to promote a type of economic development that would guarantee the safety, well-being, and strong survival of the planet (WCED, 1987, as cited in Sneddon, 2006). At that point, it was emphasized that the strategies of economic development derived from countries and regions should align with a well-organized systematic approach based on specific principles. These principles should ensure the preservation of both good survival conditions on the planet as well as a better quality of life. It is also worth noting that the publication in question was not based on a local or a national institutional level, but on the foundations of an international discussion among governance representatives. Its global character highlights the significance of the strong need for a wide constructive collaboration among different stakeholders and their efforts from different areas, fields and perspectives. From the above, we can clearly understand the mixed nature of Sustainable Development as a matter that should be approached in a multi-disciplinary manner and not just from its environmental side, as in the "green" strategies of sustainability. Its various perspectives involve different aspects and strategies that are synergistically related to the defense of our resources, but it should be noted that its spectrum is not limited to the natural resources. Specifically, as one of the most accepted definitions of Sustainable Development presents: it is a "... development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED, 1987, as cited in Halkos & Gkampoura, 2021, p.94).

In the more targeted area of the car development sector, both research and practical approaches are being promoted, integrating concepts and incorporating methods with the overall aim of making mobility more sustainable than it used to be in previous years. Most of these strategies focus on decreasing the negative environmental impact of vehicles, like CO<sub>2</sub> emissions in a much "greener" modification of the conventional manufacturing approaches. A representative example of this approach with which people have recently become more acquainted is the massive breakthrough of electric vehicles, which is becoming more and more an object of discussion. Using electric vehicles instead of the conventional ones can potentially lead to a more sustainable mobility model with an abundance of benefits related to different goals of the Sustainable Development agenda, rather than only "greening" the mobility network. Apart from electric vehicles, mobility-oriented sustainable approaches can also be supported by smart technologies and, in particular, in the urban transport systems, and therefore contributing to Sustainable Mobility and specifically to that of Smart Mobility, which is an essential element in Smart Cities. According to a well-known definition: "A smart city brings together technology, government, and society to enable the following characteristics: a smart economy, smart mobility, a smart environment, smart people, smart living, and smart governance" (IEEE Smart Cities Technical Community, n.d., as cited in Faria, 2017, p. 2). This definition includes the factor of Smart Mobility which describes: "... the use of Information and Communication Technologies in modern transport technologies to improve urban traffic" (Albino et al., 2015, p.11) or alternatively refers to a: "... local and

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

supra-local accessibility, availability of Information and Communication Technologies, modern, sustainable, and safe transport systems” (Vanolo, 2013, p.887). In this conceptual framework, autonomous vehicles are included, which appear to be the most groundbreaking part of research and approaches in the scientific area of Smart Mobility, which should not be regarded as an independent technological achievement or even as a high-level product of the car industry, but as a means for achieving certain goals of Sustainable Development agenda at a universal level.

In this context, an innovative driving model has been created, which is autonomous driving, where, at a partial or total level, human-user control becomes to some extent unnecessary. This new way, beyond road comfort, can also lead to benefits related to the principles of sustainability. Therefore, the present research thematically concerns the conceptual connection of autonomous mobility and sustainability. More specifically, it concerns the understanding of the positive relationship between these two factors by citizens since they are the potential future users and thus it must be as clarified as possible for them. Subsequently, a primary level study is being conducted to determine actual perceptions about the relationship between autonomous vehicles and Sustainable Development. These perceptions are extremely important since they will shape the background towards the arrival of such vehicles in future adaptations. More specifically, this work is based on securing a body of arguments on specific issues. For this purpose, focused primary research has been carried out on a sample of drivers, in the country of Greece, regarding the above fertile correlation. Based on this research, supplemental suggestions were drawn concerning future work regarding the matter that will be outlined.

### **Theoretical background**

To provide the initial theoretical foundations for the targeted field in question, in this section an introductory presentation will be provided, about several research examples and findings that are thematically associated with the aim of the present research material. These are studies that primarily focus on the beneficial dimension of the integrations of autonomous vehicles in road environments, particularly from the side of Sustainable Mobility. In the previous decade Malik (2017) highlighted the correlation between autonomous driving and sustainability, with classifications that aimed to illustrate the contribution of the autonomous vehicles to the latter. These categories were about: 1) Social level, like through their potential use by social groups, such as the elderly, the disabled and individuals with disorders. 2) Environmental level, emphasized by the increased capacity, reduced traffic congestion, reduction in greenhouse gas emissions etc. Furthermore, the use of their platooning is noted, where in such a scenario air resistance primarily affects the lead-driven vehicle, which appears as a shield for the others of the group. Moreover, elimination of unnecessary accelerations but also decelerations, and the matter of aggressive driving that consumes more fuel, is also mentioned. 3) Economic level describes matters as savings through engagement with other activities, as for instance, work during transport time. Additionally, a broader reduction in costs linked to transportation is also identified, due to the naturally reduced travel time.

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Another study of the following year from Bahamonde-Birke (2018) categorized their effects into direct and indirect impacts. The first group included outcomes such as the reduction of costs that are -generally- economically related to transportation, like fuel usage efficiency. Also, the reduction in expenses related to parking services due to the autonomous function of parking of the specific vehicles, is mentioned. Additionally, this study appears to trigger a discussion about a new model of public transportation that is mainly based on the use of smaller vehicles that operate in a denser network. This unfamiliar approach could enhance the appeal to public transport in citizens' preferences as more attractive. Rather than their beneficial effect associated with transportation, positive environmental aspects are noted as well. For instance, matters such as the reduction in a negative environmental footprint, the decrease in the level of exhaust emissions both on a local and global level, and improved safety in road environments. In particular, road safety can positively be assisted by minimizing risks related to human factor behaviors like interactions between drivers (e.g. hostile gestures that can escalate tension and lead to dangerous situations). Lastly, the fact that they can be potentially used by unlicensed drivers or individuals unable to drive (e.g. children, the elderly) is also highlighted in the study.

In addition, in a relative study Williams et al. (2020) presented issues such as the improved efficiency of autonomous vehicles due to reduced congestion, vehicle platooning, smoother driving, and consequently decreased fuel consumption. Moreover, about their economic dimension, their research pointed out some potentially derived changes like their use in the tourist industry for recreational travel, a more convenient delivery of goods and meals, and cheaper freight transportation which leads to lowering prices of goods, among others. The social dimension is seen as a perspective of increased safety due to the disassociation of driving from drawbacks related to human error, such as distraction, and non-immediate reaction. They can also provide new opportunities for people from low-income backgrounds, for example through ride-sharing systems that can serve as an innovative form of public transport.

Beyond the previous overview, an initial clarification in accordance with the different types of autonomous vehicles, will be provided below, based on their distinct levels. According to SAE International, the driving automation levels are defined as follows: Level 0: No Automation, Level 1: Driver Assistance, Level 2: Partial Automation, Level 3: Conditional Automation, Level 4: High Automation, Level 5: Full Automation. More analytically, Level 0: refers to a state without any automation, where the driver is fully responsible for driving. Level 1: refers to vehicles that integrate basic autonomous functions. These can assist the driver with specific controls, but drivers still have a significant operating role. Level 2: introduces a wider range of autonomous functions and therefore leads to automation in a partial manner. In this level, the vehicle can operate steering, acceleration, and braking, but it needs the driver's supervision for intervention when necessary. Level 3: signifies the start of conditional automation, where the autonomous vehicle can deal on its own functions of driving while monitoring the external environment. Level 4: represents a high-level of autonomous driving and its vehicles can operate independently on some occasions or within specific spaces, without the driver's intervention. Level 5: the ultimate type, where vehicles can deal with all aspects of driving without any involvement on behalf of human factor (SAE, 2016, as cited in Malozzi et al., 2019).

In this direction, the company of Roborace designed autonomous vehicles (Robocars) of the fifth level which were battery-electric vehicles powered by 62kWh lithium-polymer batteries and had specialized sensors to perceive conditions of external environmental factors and other systems of localization and for spatial awareness. They also had peripheral cameras, lidar systems, radars both at the front and rear, seventeen ultrasonic sensors, among other essential technical equipment as well as hardware (Betz et al., 2018). The use of such a vehicle in the context of a Roborace, appears as a representative example of a vehicle's ability to operate under the fifth level's autonomous driving with specific spatial limitations under technically defined circumstances (car race). These limitations primarily concern: 1) The vehicle remaining within a defined spatial entity for their entire performance. 2) The complete disassociation from conventional vehicles, with intelligent interaction occurring only with vehicles of the same type.

A notable related example is the one of the Mercedes-Benz research program for the autonomous F015, emphasizing on the significance of exchanging information with other vehicles, the external environment, as well as passengers. This model is equipped with laser and light projections for visual interactions with pedestrians and other vehicles. Some of its various features are adaptive cruise control and lane keeping. Some of its drawbacks are about braking and self-steering functions which are not yet at an efficient level (Yaqoob, 2019). Several depictions of the F015 show an impressive function of rotating seats so the driver can actively socialize with all the passengers during the entire route. Another case with significance for the Greek road environment was showcased in the city of Trikala, which participated in a program named CityMobil2 that introduced buses without the need for drivers and were integrated into an existing network of transportation. Their route stretched 2.4-kilometers in length, with the aim of presenting the city's landmarks for touristic purposes (Kalliaras, 2018, as cited in Papadima et al., 2020). Specifically, six autonomous buses were launched in October of 2015, with a capacity for eleven passengers (six seated, four standing, and one spot for a wheelchair user). Until 2016, the buses completed 1,490 trips in a total distance of 4,030 kilometers, and in total they transported 12,138 passengers (Portouli et al., 2017). The afore-mentioned program offers important input as an initial foundation for familiarization with autonomous vehicle performance, within a place of technical supervision and support from the relevant local authorities regarding safety issues. Secondly, to understand the positive impact of such a smart application to promote both cultural heritage and urban scenery.

Projects like the previously mentioned can provide a preparatory background for understanding towards their mass utilization on real road networks. Such an alteration can lead to the redefining of lifestyle and city planning across different sectors. Duarte and Ratti (2018) placed these changes in five fundamental areas: 1) Morphology, as today's vehicles have a specific morphology that derives from their functions and as it will change in the case of autonomous models, the morphology of road scenery will alter as well. 2) Number of vehicles on the roads, because autonomous mobility promotes car-sharing ideas for the simultaneous transportation of multiple passengers. 3) Parking spaces that could be reduced due to the reduction in the number of vehicles that will free up space occupied by conventional cars as parking spots. 4) Relieving travel-related burdens, as they will encourage people to consider living in other areas apart from cities, which will lead to less congestion. 5)

---

Potential lightening of road infrastructures, due to the data exchange between these vehicles and infrastructures, so fewer road systems may be needed to accommodate the same number of people.

In another recent study of Seuwou et al. (2019) other points according to sustainability are summarized into six classes: 1) reduction in pollution, 2) reduction in traffic congestion, 3) increase in citizen's safety, 4) reduction in noise pollution, 5) improvement in travel speed, 6) reduction in transportation costs. The last point is also correlated with car-sharing mode associated with a popular factor found in literature that is MaaS (Mobility as a Service) which essentially, has to do with a model of mobility services delivered from a provider. Such a model could free drivers from owning a vehicle and the costs that are associated with it (Coppola & Silvestri, 2019). Apart from the simpler MaaS an increasing interest is presented related to the more complex MaaS Ecosystem, that includes transportation experts, researchers, and MaaS providers and it can also be related to infrastructure, transportation services and information and payment services (Hietanen, 2014, as cited in Reyes García et al., 2019). In the case of a synergistic scenario that will involve both the concept of MaaS and autonomous vehicles, a system of ASaaS (Autonomous Shuttle as a Service) can be also formed for further extensions, with possibilities like: 1) customization to the needs of users, 2) serving areas with a lack of infrastructure, 3) reduction in noise pollution, 4) enhancement of the existing network of public and private urban mobility services (Bucchiarone et al., 2020).

Regarding the above theoretical overview, it becomes clear that the use of autonomous vehicles can modify or replace the current mobility model to a more sustainable one, indeed towards different axes of sustainability principles. It should also be noted that the introductory understanding provided of such arousing possibilities can only be roughly outlined as autonomous mobility concerns state-of-the-art research of the car industry, with a small body of representative examples and therefore it cannot be strictly specified. Yet, people already form strong opinions upon the existing scenarios and in most of the cases these are mainly associated with the aspects of the user's experience (e.g. road comfort) rather than the ones linked to sustainability, which should be kept in mind for the defense of their future integration in the road environments.

## Methodology

The methodological tool selected is of primary level research (data collection) which was carried out on a statistical sample of Greek Drivers (163 people), via an online electronic survey with a questionnaire (form in Google Forms and distributed in June of 2024) upon specific points that need to be checked. These points are based on the research axes, which concern both the corresponding positive outcomes and the concerns that contribute to a partially flawed knowledge regarding the role of autonomous vehicles in sustainable mobility.

## Results

The specific section presents the results of the survey and more specifically statistics that illustrate the findings. Apart from the table presented below regarding the first twelve

| 9. Are you aware of the existence of research and implementations on vehicles capable of navigating without significant or complete human intervention?                                                           | No    | Yes   |
|                                                                                                                                                                                                                   | 32,5% | 67,5% |
| 10. Have you ever driven a vehicle that operates without any human intervention (e.g. steering wheel operation)?                                                                                                  | No    | Yes   |
|                                                                                                                                                                                                                   | 65%   | 35%   |
| 11. Are you positive about the total or partial replacement of specific functions of conventional vehicles, which you use as a driver, by autonomous functions (e.g. autopilot mode on straight routes for rest)? | No    | Yes   |
|                                                                                                                                                                                                                   | 34,4% | 65,6% |
| 12. Are you positive about the total or partial replacement of conventional vehicles by autonomous vehicles (e.g. in specific spatial units, such as cultural routes and for designated uses, tracks)?            | No    | Yes   |
|                                                                                                                                                                                                                   | 25,8% | 74,2% |

From the 13<sup>th</sup> question: “Provide an example of identifying the contribution of autonomous vehicles to Sustainability from an environmental perspective (2 to 3 lines).” and onward, a significant degree of freedom was given as short written responses were requested. The overall responses of the 13<sup>th</sup> question were grouped into the following categories:

- 1) Group A: Reduction of environmental pollution.
- 2) Group B: Conversion of occupied stopping and parking spaces into green areas.

Below there are some characteristic responses from each group, which stood out:

- 1) “Low pollutant emissions into the environment,” “Precision on handling to reduce emissions,” “Fewer emissions from the vehicle manufacturing stage, as fewer vehicles will be produced.”
- 2) “Promotes prosperity without the simultaneous abuse of land and the squandering of resources,” “Reduction of road network sections for cars and their conversion into areas for planting trees and plants.”

Regarding the first category, an important finding emerges about the understanding of the variety of polluting functions associated with the traditional vehicles with which these drivers are more familiar. In particular, the first answer is quite common, referring to the direct environmental impact of the car itself, but in addition, the polluting stage prior to its operation -manufacturing- is correctly mentioned, as it has a significant impact on the increase in carbon footprint among other negative aspects. Secondly, there are some references made to address the squandering of valuable spatial units that could be reclaimed by citizens as green spaces.

In the 14<sup>th</sup> question: “Provide an example of identifying the contribution of autonomous vehicles to Sustainability in terms of the economy (2 to 3 lines)”, responses were likewise categorized into the following groups:

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- 1) Group A: Saving money through reduced fuel consumption etc.
- 2) Group B: Saving money due to a decreased need for private vehicle ownership per individual or family.
- 3) Group C: Creation of new opportunities and job positions.
- 4) Group D: Reduction or complete avoidance of taxes related to private vehicles.

The new representative responses from each group were as follows:

- 1) “Reduction of fuel expenses,” “Less fuel due to improved driving behavior,” “Lower servicing needs due to fewer accidents.”
- 2) “No need for each family to purchase a car (often more than one vehicle per family),” “Reduction in private cars.”
- 3) “Creation of new jobs,” “New synergies with more technologically skilled staff; knowledgeable in modern technologies.”
- 4) “If we use autonomous public transport, we won’t be burdened with related taxes,” “An end to costly taxes on private vehicles.”

This set of responses is especially interesting from the perspective outlined in the first category, as Greek drivers appeared to be positive towards saving on fuel, an issue that has consistently burdened households, particularly in the modern era where costs are becoming higher and there is an increasing interest in exploring alternative, more economical energy sources. At the same time, extra money savings are approached from the side of the reduced necessity in buying a private vehicle. This is a benefit of high importance in the country of Greece, where it is very common for a family to own more than one car, which in many cases is extremely expensive both in terms of purchasing it but also its maintenance, service etc. In the third category of responses, there appears to be a significant interest, as it is shown that Greek drivers do not oppose autonomous vehicles with the typical hostile argument according to which there would be less job positions. On the contrary, they are of the opinion that new jobs will be created, which in many cases might be ideal for technologically skilled individuals. Finally, taxes are also considered, which is logical as the tax system heavily burdens citizens who should be relieved.

In the 15<sup>th</sup> question: “Provide an example of identifying the contribution of autonomous vehicles to Sustainability from a societal perspective (2 to 3 lines)”, the most relevant responses were grouped as follows:

- 1) Group A: Equal opportunities for access to transport for all.
- 2) Group B: Protection of public health and well-being through safer road networks.
- 3) Group C: Releasing occupied urban spaces for other uses.
- 4) Group D: Ease, comfort, and social interaction.

The most characteristic responses about the above question from each group included:

- 1) “Easy access for everyone,” “Easier vehicle uses for every person.”
- 2) “Fewer accidents,” “Compliance with traffic laws.”
- 3) “Bike lanes / walking paths,” “Liberation of spaces and their conversion into cultural and recreational areas, etc.”
- 4) “Social well-being,” “Ease of driving,” “Reduction in traffic congestion and time that individuals spend on the road.”

In this group of responses, it appears that individuals have efficiently understood the distinction of the positive social impact of autonomous vehicles compared to other categories

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

of advantages. As it is also derived from many literature sources, many responses refer to the immediate benefit of reducing traffic accidents and the ease of use. Furthermore, a significant number raised the question of the inclusion of individuals who, in this innovative scenario, would be able to enjoy equal transport opportunities. The spatial impact on the urban environment is also emphasized, particularly the freeing up of spaces that can be reclaimed and repurposed for public use. The specific beneficial aspect strongly underlines the significant social dimension of such a shift in mobility models.

The responses of the final 16<sup>th</sup> question: “Give an example of identifying the contribution of autonomous vehicles to environmental, economic and social sustainability (2 to 3 lines)”, due to its complexity as it requires thinking about a combination of the three axes of Sustainable Development, could not be grouped. Therefore, just two responses are presented which are worth noting since they address all of the main concepts successfully:

“Easier parking, therefore less fuel consumption, pollution, and better mental health.”

“Fleets of such vehicles on small Greek islands for tourist routes, as tourists often get into accidents due to intoxication.”

The above responses show a fairly good understanding on behalf of Greek drivers regarding the potential different side of benefits that can simultaneously contribute to the essential factors of sustainability, that also lay the foundations for an interesting discussion on future mixed sustainable applications of the specific type.

## Conclusions

This research regarding an examination towards the cognitive relationship between autonomous mobility and sustainability, provided representative findings from a sample of Greek drivers. The Greek respondents can be characterized as efficiently being familiar with the given concept and that appears as a positive sign for their transition to the new models of sustainable autonomous mobility. Regarding their current knowledge about the wider nature of sustainability sectors, they recognized it correctly as a matter with several dimensions and not strictly based on the more familiar environmental dimension. Yet, it is not a positive reflection of their understanding that a significant number of participants did not agree on Sustainable Development as a global “bet” that needs international attention and collaboration as well. Moreover, most of the respondents consider Sustainable Development Goals potentially achievable through smart technology rather than without it, which may serve as one of its key elements, but it is not inseparably connected with it. Similarly, it appears that a significant percentage of Greek drivers also consider Sustainable Mobility as a matter that is exclusively associated to smart technology, which is a common misconception most likely associated to the general approach of cars as technological products and not as tools to shape wider sustainable strategies. Via the questions of the most practical section of the questionnaire, it was noted that the majority of the respondents are aware of the partial or total replacement of vehicle functions with autonomous ones, but without hands-on experience. However, it was shown that they are generally not opposed to the idea of partial or full autonomous mobility, which can possibly lead to fertile grounds for future implementations such as the ones that had been mentioned. Finally, as concerns their specific examples about their contribution to sustainability, they emphasized on the reduction of pollution, advantages

## PROCEEDINGS

---

related to land use, money saving, new jobs, inclusivity and accessibility, road safety, increased social interaction due to the diminished or eliminated role of driving among others. As regards their suggestion about a triple contribution, unfortunately groups of similar answers could not be formed to provide secure conclusions on the matter. Overall, it appears that they have a respectable degree of awareness regarding the principles of Sustainable Development and Sustainable Mobility, but further education on the matter is necessary for a thorough understanding. On the other hand, they seem more theoretically familiar with autonomous vehicles than with their practical use, yet concerning their connection to Sustainable Mobility their knowledge is at a relatively satisfactory level that creates a positive climate for such a potential future shift. Future research axes were shaped to explore more specific attitudes of Greek drivers towards related applications that have been -successfully or unsuccessfully- implemented in foreign cities for a better understanding via detailed scenarios. Such supplementary research can investigate their views in more detail towards establishing potential Greek versions of autonomous mobility applications based on the former, which will serve as preparatory background towards the more specific applications in Greek road networks, with a focus on the most crucial problems that should be addressed related to the targeted drawbacks in the country of Greece.

#### **Abstract**

Access to sustainable and affordable energy is the fundamental principle of the 7<sup>th</sup> Sustainable Development Goal (SDG), highlighting the pivotal role of energy in driving global development. The European Union (EU) recognizes energy as an essential right for everyone, as emphasized in its energy policies. Nevertheless, despite these initiatives, energy poverty significantly impacts the EU population, hindering equal societal progress and prosperity. Although the EU focuses on cohesion among its member states, Southern European countries experience more severe energy poverty despite having milder winter conditions. Aiming to capture energy poverty occurrence in Southern European countries, this study employs statistical analysis focusing on Greece, Italy, Spain, and Portugal for 2012-2022. The outcomes reveal that Southern European countries bear a disproportionate burden, highlighting the region's vulnerability. Furthermore, significant disparities within South European countries are evident since some countries bear a disproportionate burden, highlighting regional vulnerability.

#### **Abstract**

The texts of travelers, such as the descriptions of monasteries by Cristoforo Buondelmonti in the 15th century or Tournefort in the 17th century, contain valuable information about the architecture, the daily life of monks, and the spiritual role of monasteries. Travelers from Europe were often impressed by the location of the buildings, the natural beauty of the landscapes surrounding them, and the monastic life. The architecture also aroused their interest, such as Gerola, who was fascinated by the monasteries of Tzagarolon, Arcadi, Preveli, or Toplou. But the descriptions also give us information about a different aspect of the life of the monasteries, that of the development of some early form of economic activity.

This activity continues today in many of them and is an example that blends tradition with modern business strategy, which is now becoming necessary for their survival. The economic activities of the monasteries have important social implications as they contribute to sustainability by creating jobs, especially in rural and isolated areas, and often support, as their ‘raison d’être’ requires, charitable projects. Now days they are important tourist destinations, attracting visitors interested in history, nature, art and organic products and enhancing the economic sustainability of a place. The business initiatives of the monasteries serve as models of sustainable development.

The article presents Holy Monasteries through the writings of travelers and, with the help of a survey of a sample of 113 people, tries to approach the way in which Holy Monasteries bridge the past with the present and the innovative practices they engage in order to maintain a unique role in contemporary society by combining culture and economy.

**Key Words:** travel texts, travelers, monasteries, entrepreneurship, sustainability, tourism

---

### **An introduction to the Sustainability**

Sustainability is a central issue in global discussions, as environmental degradation threatens humanity's viability. The United Nations defines sustainability as balanced development that considers both economic growth and respect for the environment and society. The Brundtland Report (1987) highlighted the need to address the environmental crisis, emphasizing that meeting present needs should not compromise the ability of future generations to meet their own. This led to reforms and policies for environmental protection, while the Rio Summit (1992) reinforced the connection between development and environmental conservation, establishing institutions such as the Commission on Sustainable Development.

The concept of sustainability is based on three pillars:

- Social dimension: Promoting well-being and social cohesion for both present and future generations.
- Environmental dimension: Protecting and preserving natural resources.
- Economic dimension: Ensuring long-term economic growth while respecting society and the environment.

In 2015, the 2030 Agenda for Sustainable Development reaffirmed the fundamental role of sustainability in creating a fairer world.

### **Sustainable Tourism**

In the tourism sector, sustainable development is considered crucial, with Goals 4.7 and 11.4 emphasizing the importance of cultural heritage. According to researchers, tourism should adapt to local social, cultural, and environmental structures, especially as issues such as over-tourism and rural depopulation present challenges (Kokkosis & Tsartas, 2019; Kizos, 2018). Sustainable tourism promotes a balance between societies and the natural environment, while alternative tourism offers solutions that integrate environmental responsibility and local development (Kokkosis et al., 2011). At the same time, travelers seek authentic experiences, making strategic planning and the implementation of sustainable practices essential. The relationship between culture and tourism is considered significant for preserving traditions and ensuring the sector's long-term sustainability (Terkenli & Georgoula, 2022).

One form of alternative tourism is literary tourism, which provides a sustainable and authentic solution by promoting culture through literature.

### **Literature as a form of sustainable Tourism**

Culture serves as a mirror of human creativity throughout time and space, expressed through social activities and the production of material and intellectual values. Many tourists choose destinations based on their cultural significance. According to McKercher and Du Cros (2015), cultural tourism offers visitors the opportunity to engage with a place's cultural heritage, combining entertainment, education, and a more immersive experience. Literature, as one of the primary forms of cultural expression, plays a central role in this process.

Literary tourism is an emerging sector that merges a passion for books with exploration. Visitors seek locations associated with literary works, whether due to the presence of authors

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

or the fictional worlds created in stories (Fawcett & Cormack, 2001). Manola (2019) notes that readers aspire to experience the world depicted in a book in a tangible way. This form of tourism enhances a place's uniqueness and promotes sustainable development. As highlighted by Della Spina & Giorno (2021), an interdisciplinary approach can offer new ways of understanding cultural landscapes and enhance their sustainability.

Literature has the potential to increase a location's touristic appeal, adding a new dimension to its cultural interest. Many areas have gained tourism popularity due to literary works (Manola, 2019; Tsatalbassoglou, 2019; Manola & Tsatalbassoglou, 2021; Manola et al., 2021). Literary routes facilitate the understanding of cultural heritage by connecting places with historical events and landmarks (Mitoula et al., 2008). Simultaneously, they enhance the attractiveness of destinations and contribute to their sustainability (Mitoula & Kaldis, 2018).

Additionally, literary works, including travel writings, offer an interactive experience, allowing travelers to follow in the footsteps of authors and literary characters, explore landscapes, and participate in activities while maintaining respect for the environment. Technological innovations, such as virtual reality, open new possibilities for enhancing these experiences (Tsatalbassoglou et al., 2024). Travel literature is a distinct form of literary expression with a direct connection to tourism.

### **A special form of literature: “Travel texts”**

Greece's geographical location at the heart of the Mediterranean has established it as a crucial hub for commercial and religious journeys, particularly towards the East and the Holy Lands. Recognizing its significance, the Venetians and Genoese set up supply stations in Greek ports to facilitate travelers. Many of these travelers wished to document their experiences, producing detailed narratives that evolved into early travel guides. According to Viggopoulou (2005), these texts blend personal impressions with practical information, serving as important historical sources despite containing subjective elements (Tsatalbasoglou & Manola, 2024a). Simopoulos (1999) highlights that these narratives preserve invaluable details that might otherwise have been lost, offering insights into the past of Greek society.

Greece's strategic position at the crossroads of three continents makes it a convergence point of diverse cultural influences, shaping its image both in the West and the East (Manola & Tsatalbassoglou, 2020). During the Crusades, Crete functioned as a supply station but gradually emerged as a tourist destination. Under Venetian rule, interest in the island increased, with travelers recording their experiences and others sending reports to their superiors. These historical narratives contribute to shaping modern tourism by promoting sustainable routes and incorporating lesser-known sites into tourism planning (Tsatalmbasoglou & al., 2024b). The use of new technologies allows for the development of strong and balanced experiences that benefit local communities while addressing issues of overtourism, particularly in northern Crete.

Beyond their artistic value, travel narratives provide valuable insights across various academic disciplines. In an era of information overload, studying these texts can inspire sustainable tourism practices and support the development of strategic approaches for the future.

### Travelers and Sacred Monasteries of Crete

Sacred monasteries serve as focal points for travel, primarily due to their connection to religious sentiment. Pilgrimage is a way for individuals to seek a closer relationship with the divine, combining travel to a sacred place with a deeper spiritual experience. Through this process, the pilgrim distances themselves from material needs and daily life, striving for spiritual fulfillment. Thus, it is not merely a journey to a specific location but also an internal quest that often leads to travel-related activities (Timothy, 2002; Moira, 2003; Laclali & al, 2019). Religion and tourism are distinct concepts: pilgrimage focuses on religious experience and faith, whereas religious tourism perceives sacred sites as cultural monuments (Timothy, 2002). Although separate phenomena, both relate to human spirituality.

Significant interest has been shown in the sacred monasteries of Crete, which have played a major role in the cultural and daily life of local society. Travel writings also contain descriptions of these monastic sites. Some of the following are from the site “travelogue.gr” of the Aikaterinis Laskaridis Foundation:

- the drow of Pashley for the Tzagarolon Abbey

*Figure nr 1: Pashleys' Moni Tzagarolon, Resource: travelogue.gr*

- William Stewart, in his work published in 1867, highlights that "Arcadi has been a symbol of the resilience and self-sacrifice of the Cretans; this monastery is not only a religious monument but also a symbol of Cretan freedom".

*Figure nr 2: Arcadi Monastery Resource: arcadimonastery.gr*

## PROCEEDINGS

---

- Toplou monastery was mentioned by many travelers as for example De la Croix, who in 1806 reports it “as a strong refuge, which has the capacity to withstand even the most severe attack”

Figure nr 3: “Toplou”, Resource: [ikivotos.gr](http://ikivotos.gr)

- As seen in Boissonnas’ photographs, activities to ensure self-sufficiency and support their social and charitable missions. He made many photos with the activities of the Monasteries and the villagers that they used to work at them

Figure nr 4: Olive harvest at Moni Prevelis by Boissonnas  
Resource: [travelogues.gr](http://travelogues.gr) /Baud-Bovy, D., Boissonas, F.

Historically, monasteries have functioned as centers of economic activity, managing assets and engaging in productive activities to ensure their self-sufficiency and support charitable initiatives (Kavvadias, 2024) by developing an early form of entrepreneurship.

### Entrepreneurship and Holy Monasteries

Entrepreneurship is defined as the process of identifying, developing, and leveraging opportunities to create value through innovation and resource organization, with the aim of establishing or expanding business activities (Spiliotis, 2017). Within the context of monasteries, entrepreneurship acquires unique characteristics, combining economic activity with a spiritual mission. In the modern era, monasteries continue to contribute to the economy through activities such as agricultural production, hospitality for pilgrims, and the publication of religious texts. Entrepreneurship within monasteries constitutes a complex phenomenon

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

that integrates economic activity with spiritual and social missions, offering valuable insights for contemporary business practices.

Here is important to highlight that according to the Greek Orthodox religion it is necessary to maintain a balance between economic development and their spiritual mission, monasteries follow certain fundamental principles. First, their business activities are based on ethical values, avoiding practices that contradict Church teachings. Second, they strive for economic independence without seeking wealth accumulation, instead allocating their revenues to community needs and charitable efforts. Additionally, monasteries maintain strong ties to tradition by engaging in activities such as agriculture, beekeeping, handicrafts, and the publication of religious texts. At the same time, they operate with transparency to ensure the trust of the faithful. A significant portion of their profits is dedicated to social welfare, supporting vulnerable groups through charitable initiatives, education, and healthcare. Finally, labor within monasteries is considered an integral part of daily life, harmonized with prayer to avoid distracting monks from their spiritual path. (Ware 1993; Giovanoglou, 2020). So in some of the above points the Holy Monasteries seems to have a very modern prospective similar to the Corporate Social Responsibility because they can positively influence job creation and contribute to the overall well-being of local communities. Research indicates that corporate CSR activities add value to public and tertiary sector tools, strengthening their capacity to support economic and social development (Mitoula and Astara, 2012).

## Research and Results

A total of 113 individuals were surveyed, all participants were adults and took part voluntarily and anonymously between July 13th and 20th of 2024.

The research employed a purpose sampling method, which was chosen because of the small sample with a mainly informative character with comparable characteristics [Durbarray, 2020] from the city of SITIA, the nearest town to Toplou Monastery, one of the most famous of Crete. A structured questionnaire with closed-ended questions was used, and respondents were independent travelers, not part of an organized tour.

Sitia was chosen due to the fact that it is the closest city to the historic Holy Monastery of Toplou, which due to its religious and cultural importance, and the development of a particular business activity, indicates that the monastery is a multidimensional attraction. This means that the promotion of the Holy Monastery of Toplou can target different audiences, enhancing the attractiveness of the area for cultural, religious and gastronomic tourism, which makes it an ideal location for this preliminary research.

The study focused on exploring factors that shape tourists' perspectives on:

- The role of literature through travelers texts in promoting tourism in the Sitia region.
- Tourists' reflections on previous literary tourism initiatives.
- The possibility of achieving sustainable cultural growth in the area.
- The visitors' opinions regarding the development of entrepreneurship by monasteries, focusing on their perception of the role of monasteries in the local economy

### Demographic data

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

- SEX: Regarding demographic data, from the sample 45 people has choosen male, 63 female and 5 chose ‘Other’.
- AGE: At the ages of 12 they belonged to the 18-25 group, 22 to the 26-40 group, 27 declared themselves to be in the 41-60 group and 52 people declared themselves to be over sixty years old.
- EDUCATION: The largest percentage completed secondary education, specifically 49 people. 13 lower secondary, as well as 13 Trainning Institute, 25 university, 12 master and 1 PHD.

Below are some of the research questions of the descriptive statistic:

Question nr 6: Could the following reasons affect literary tourism?

*Figure nr 5: Chart 1- Literary tourism as a factor*

The contribution of literature to the sustainable development of a place, according to the interviewees, depends largely on the opportunity given to differentiate a place from others, a choice chosen by 63 individuals. The development of new initiatives is chosen by 72 individuals, the protection of the environment (69), as well as of cultural heritage (57 persons), and the expansion of seasonality (69 persons)

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Question nr 7: “How likely are you to follow travel texts from earlier centuries as a guide on your journey?”

Figure nr 6: Chart 2- travel texts and selection of a place

Regarding the question about the possibility that the interviewee would show interest in following the travel texts, as can be seen from the diagram, a total percentage of around 33% (37 persons) responded positively, 19% (22 pax) is neutral, and a percentage of 38% (which is 43 persons) responded negatively.

Question nr 8: “What is the main reason you would probably not follow old travelogues on your travels?”

Figure nr 7: Chart 3- follow a travelogue

The next question concerns the reasons why interviewees would not follow a travelogue from another era. It is particularly interesting that most people consider as an important reason, as can be seen from the graphic, the fact that they prefer an "easy and fast" presentation from modern websites at a rate of 59% (51 individuals), followed by the lack of interest in historical data at 18% (22), the difficulty in studying the language of another era, “never thought” was chosen from 27 persons and finally the lack of digital applications at a rate of 9% (8).

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

Question nr 9: “What is your opinion on the involvement of Holy Monasteries in business activities?”

Figure nr 8: Chart 4- Monasteries & entrepreneurship

As can be seen from the chart, the option that wins the largest percentage is "agree" as it gathers 41 people. “Totally agree” was chosen by 35 interviewees, 30 people chose “rather”, 4 “disagree” and 3 “totally disagree”.

Question nr 10: In your opinion, what is the role of monasteries in the economic development of local communities?

Figure nr 9: Chart 5- Monasteries & local community

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

As shown from the chart, for the answer “strongly agree” we have 86 persons for “Monasteries strengthen the local economy through the production and sale of monastic products (e.g. honey, wine, cheese) . The second choice with 78 answers is “ They provide jobs either directly or indirectly through cooperation with local producers” , then 73 person has given “They contribute to tourism, as they attract visitors who strengthen the hospitality and catering industry” and the fourth answer was chosen by 67 person “They invest in infrastructure and maintain traditional buildings, upgrading the area”.

Question nr 11: To what extent does monastic activity contribute to the preservation of cultural heritage and local traditions?

Figure nr 10: Chart 6- Monasteries & heritage

As shown from the chart the answer “strongly agree” was given for 93 persons for the choice “They support the preservation of traditional gastronomy through the products they produce”. The second place is taken by They transmit local tradition through iconography, music and handicraft” with 81 answers. As third choice given is with 74 persons “They preserve and restore historical buildings, archival material and relics” and with 56 answers “They function as cultural education centers, hosting seminars and events”

## PROCEEDINGS

2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025

Question nr. 12: Are there opportunities to expand the business activity of monasteries beyond religious tourism? If so, what are they?

Figure nr 11: Chart 7- expand activities- The answer “strongly agree”

“Development of eco- and agro-tourism through organic farming and hosting visitors in traditional cells”, gave as an answer 62 persons. The “Creation of e-commerce” in order to to sell monastic products internationally gave 67 person. The answer “Development of alternative activities, such as handicraft workshops, botany and hagiography seminars” was the first choice of 51 person while “Cooperation with educational institutions for cultural heritage studies” was chosen from 55 person

Question nr. 13: «What are the factors that could influence your choice to buy a product from a Monastery?»

Figure nr 12: Chart 8- factors that could influence

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

The quality and authenticity of the products is a strong motivation, since 63 people from the sample answered “strongly agree”. The connection of the products with the tradition and history of the monastery is important enough, and we have 64 “strongly agree” and 33 “agree”. Ecological and biological certifications are a condition that should now be taken seriously by the authorities as it is also a guarantee for the quality of the products. “Strongly agree” was chosen by 46 people as a prerequisite. Emotional and religious reasons, as many products have been blessed is a “strongly agree” answer for 62 people while “agree” was given from 32 people, so it is a very strong motivation. The ‘Proper promotion and positioning’ is a strongly motivation for only 19 people.

### Discussion

The research findings indicate that the majority of respondents agree that monasteries play a crucial role in preserving cultural identity. This is because monastic activities contribute to the preservation of traditional arts, architectural monuments, and cultural practices, rendering monasteries vibrant centers of cultural heritage. Moreover, respondents expressed a willingness to engage in alternative forms of tourism, such as literary tourism, particularly in relation to travel literature, provided they were more familiar with these texts. It is important to consider the dynamic potential of travel literature when properly highlighted, as there is a lack of awareness regarding their existence and insufficient utilization through new technologies.

The responses further reveal that a significant proportion of participants recognize the positive contribution of monasteries to the local economy. This occurs through activities such as the production and promotion of local products, the attraction of tourists throughout the year, and the creation of employment opportunities.

Based on the findings, there appears to be considerable potential for expanding monastic activities into areas such as agritourism, sustainable production on a larger scale, and new initiatives like education in traditional arts. The positive reception from respondents suggests that the public is open to innovative approaches that maintain the monastic character while enhancing its economic dimension. However, this expansion must be grounded in authenticity, quality, and a strong connection to tradition, as these are key factors influencing consumer behavior. The findings indicate that consumers appreciate monastic products not only for their religious significance but also for their high quality and local character.

### Conclusion

The travel text could create new paths for an alternative form of tourism, even more so if combined with other practices such as the development of soft form of entrepreneurship. The utilization of monastic products in the tourism sector has the potential to yield significant benefits and strengthen the local economy. Through the implementation of processes such as certification, branding can be enhanced—an essential factor in the promotion of monastic products—as it contributes to the establishment of a strong identity and the strategic positioning of these products in the market. The fact that a large proportion of respondents consider branding important underscores the significance of storytelling and authenticity in

## PROCEEDINGS

*2nd Open-Air Cities International Conference “Local & Regional Sustainable Development and Urban Reconstruction”, Harokopio University of Athens, February 14-16, 2025*

---

shaping consumer perceptions. Entrepreneurship within monasteries represents a unique model of economic activity that integrates financial sustainability with spiritual and social missions. Developing a structured promotional strategy that highlights monastic production can increase brand recognition and attract a broader audience, thereby enhancing the competitiveness of these products.

Furthermore, strengthening monastic entrepreneurship requires the adoption of policies and strategies that support sustainable development and the outward orientation of monasteries. The positive stance of respondents confirms the necessity of state or private initiatives aimed at enhancing funding, visibility, and networking for monastic enterprises. The implementation of such policies, informed by further research, could contribute to the preservation of monastic tradition while simultaneously reinforcing the role of monasteries in both the local and national economy.

### CULTURAL ENTREPRENEURSHIP AND SUSTAINABLE DEVELOPMENT IN LEMNOS

**Maniou Fotini**

*PhD C, Harokopio University of Athens*

[fmaniou@hua.gr](mailto:fmaniou@hua.gr)

#### **Abstract**

Lemnos, one of the outlying islands of Greece, occupies a special place in the national and cultural map of the country. Its geographical location in the northeastern Aegean Sea and its proximity to the border with Turkey give it strategic importance, while its rich history and cultural heritage make it an important hub between the ancient and modern world.

The present study aims to highlight the tangible and intangible cultural heritage of Lemnos, while examining the potential for enhancing cultural entrepreneurship as a key driver of sustainable development for the island. The themes explored include the importance of religious monuments, gastronomy, cultural events - such as music and dance festivals - the management of archaeological sites and the contribution of literature, through the works of Yannis Ritsos and other authors inspired by Lemnos.

As part of the study, a quantitative analysis was carried out using questionnaires distributed exclusively to residents of Lemnos. Data collection focused on recording and analyzing the views of local people on the potential and opportunities that cultural entrepreneurship provides for the sustainable development of the island. The results of the survey aim to formulate recommendations for linking local cultural heritage with economic, social and environmental sustainability, enhancing local identity and development.

**Key words:** Cultural entrepreneurship, sustainable development, Lemnos

#### **Abstract**

Daphni is an eleventh-century monastery on the outskirts of Athens. It is considered a superb example of Middle Byzantine architecture, with sublime mosaics representing the visualisation of the Christian cosmos. The monastery is inscribed on the UNESCO World Heritage Sites list and has attracted significant scholarly attention. The ravages of time and a destructive earthquake in 1999 triggered an extensive, multi-million-dollar restoration project funded by the Greek state and the European Union to preserve the building and the mosaics for future generations.

The popularity of neoclassicism in the 19th century condemned many remnants of Byzantine architectural heritage to oblivion. However, the concerted efforts of European artists, architects, and archaeologists eventually contributed to the study, rescue, and conservation of the most prominent religious buildings. In the 1870s, the historian Konstantinos Paparrigopoulos integrated the Byzantine Empire into Greek history. Preserving Byzantine and medieval monuments became necessary to serve the broader goals of the Great Idea.

Contemporary attitudes toward Byzantine monuments are less ideologically charged, but the meaning and significance of the monuments to the public continue to evolve. Cultural heritage has become a cornerstone of sustainable development at a local level, which raises

interesting questions regarding the enhancement of the Daphni Monastery's tourist potential. Is the monastery's value known to the general public? What elements impress its visitors? Is public transport accessibility satisfactory? Finally, what cultural entrepreneurship opportunities does the monastery offer to assist local development?

As part of the study, Daphni Monastery visitors received questionnaires to explore their attitudes towards the monument. The survey will underpin efforts to develop the area's cultural entrepreneurship potential and to enhance Daphni Monastery's visibility and popularity as a tourist destination. The proposals include improving access, strengthening cooperation with local businesses, and promoting Daphni Monastery as an essential cultural destination.
